IEEE Standard for Local and Metropolitan Area Networks: Overview and Architecture

Amendment 2: Registration of Object Identifiers

Sponsor
LAN/MAN Standards Committee
of the
IEEE Computer Society

Approved 25 March 2004
IEEE-SA Standards Board

Abstract: IEEE Std 802-2001, IEEE Local and Metropolitan Area Networks: Overview and Architecture, provides an overview to the family of IEEE 802 standards. This amendment to IEEE Std 802-2001 specifies an Object Identifier hierarchy used within IEEE 802 for uniform allocation of Object Identifiers used in IEEE 802 standards.

Keywords: Local Area Networks (LANs), Metropolitan Area Networks (MANs), LAN/MAN architecture, LAN/MAN reference model, Object Identifiers

No part of this publication may be reproduced in any form, in an electronic retrieval system or otherwise, without the prior written permission of the publisher.

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied “**AS IS.**”

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that his or her views should be considered the personal views of that individual rather than the formal position, explanation, or interpretation of the IEEE.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with IEEE. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Comments on standards and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board
445 Hoes Lane
P.O. Box 1331
Piscataway, NJ 08855-1331USA

NOTE—Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. The IEEE shall not be responsible for identifying patents for which a license may be required by an IEEE standard or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

Authorization to photocopy portions of any individual standard for internal or personal use is granted by the Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to Copyright Clearance Center. To arrange for payment of licensing fee, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

Introduction

(This introduction is not part of IEEE 802b-2004, IEEE Standard for Local and Metropolitan Area Networks: Overview and Architecture—Amendment 2: Registration of Object Identifiers).

IEEE Std 802b-2004

IEEE Std 802 provides an overview to the family of IEEE 802 standards, describes the relationship of the IEEE 802 standards to the Open Systems Interconnection Basic Reference Model [ISO/IEC 7498-1: 1994] and explains the relationship of these standards to higher layer protocols, provides a standard for the structure of LAN MAC addresses, and provides a standard for the identification of public, private, and standard protocols. This amendment to IEEE Std 802-2001 defines an Object Identifier hierarchy used within IEEE 802 for uniform allocation of Object Identifiers used in IEEE 802 standards.

Notice to users

Errata

Errata, if any, for this and all other standards can be accessed at the following URL: <http://standards.ieee.org/reading/ieee/updates/errata/index.html>. Users are encouraged to check this URL for errata periodically.

Interpretations

Current interpretations can be accessed at the following URL: <http://standards.ieee.org/reading/ieee/interp/index.html>.

Participants

When the IEEE 802a Working Group approved this amendment, it had the following membership:

Tony Jeffree, *Chair and Editor*

Neil Jarvis, *Vice Chair*

Floyd Backes
Les Bell
Paul Bottorff
Laura Bridge
Jim Burns
Dirceu Cavendish
Paul Congdon
Hesham Elbakoury
Norm Finn
David Frattura
Gerard Goubert

Steve Haddock
Ran Ish-Shalom
Hal Keen
Bill Lane
Roger Lapuh
Loren Larsen
Dinesh Mohan
Bob Moskowitz
Don O'Connor
Glenn Parsons
Frank Reichstein

John Roesse
Allyn Romanow
Dan Romascanu
Dolors Sala
Mick Seaman
Kazuo Takagi
Michel Thorsen
Dennis Volpano
Karl Weber
Michael D. Wright

The following members of the balloting committee voted on this amendment. Balloters may have voted for approval, disapproval, or abstention.

Toru Aihara	Jose Gutierrez	Apurva Mody
Vishal Anand	Chris Guy	Oliver Muelhens
Butch Anton	Christopher Hansen	Bob O'Hara
Daniel Bailey	Neil Jarvis	Satoshi Obara
Jacob Ben Ary	Tony Jeffrey	Sebastien Perrot
Gary Bourque	David Johnston	Stephen Palm
Edward Carley	Joe Juisai	Roger Pandanda
Clint Chaplin	Thomas M. Kurihara	Subbu Ponnuswamy
Keith Chow	Srinivas Kandala	Maximilian Riegel
Christopher Cooke	Patrick Kinney	David Rockwell
Todor Cooklev	David Law	John Sarallo
Javier del Prado Pavon	Pi-Cheng Law	Gil Shultz
Thomas Dineen	Randolph Little	Thomas Starai
Dr. Sourav Dutta	Gregory Luri	Adrian Stephens
Clint Early	Ryan Madron	Carl Stevenson
Michael Fischer	Nikolai Malykh	Vincent R Surillo
Will Foulds	Roger Marks	Balchandra Vaidya
Stephen Fratini	John Messenger	Scott Valcourt
James Gilb	George Miao	Michael Wright
	Yinghua Min	Oren Yuen

When the IEEE-SA Standards Board approved this standard on 25 March 2004, it had the following membership:

Don Wright, Chair
Steve M. Mills, Vice Chair
Judith Gorman, Secretary

Chuck Adams	Mark S. Halpin	Paul Nikolich
H. Stephen Berger	Raymond Hapeman	T. W. Olsen
Mark D. Bowman	Richard J. Holleman	Ronald C. Petersen
Joseph A. Bruder	Richard H. Hulett	Gary S. Robinson
Bob Davis	Lowell G. Johnson	Frank Stone
Roberto de Boisson	Joseph L. Koepfinger*	Malcolm V. Thaden
Julian Forster*	Hermann Koch	Doug Topping
Arnold M. Greenspan	Thomas J. McGean	Joe D. Watson
	Daleep C. Mohla	

*Member Emeritus

Also included are the following nonvoting IEEE-SA Standards Board liaisons:

Satish K. Aggarwal, *NRC Representative*
Richard DeBlasio, *DOE Representative*
Alan Cookson, *NIST Representative*

IEEE Standard for Local and Metropolitan Area Networks: Overview and Architecture

Amendment 2: Registration of Object Identifiers

[This amendment to IEEE Std 802[®]-2001 defines the changes necessary in order to define an Object Identifier hierarchy used within IEEE 802 for uniform allocation of Object Identifiers used in IEEE 802 standards. These changes are defined as a series of additions to, and modifications of, the existing text of IEEE Std 802-2001; this amendment therefore assumes all material, including references, abbreviations, definitions, procedures, services and protocols defined in the base text.]

NOTE—The editing instructions contained in this amendment define how to merge the material contained herein into the existing base standard to form the comprehensive standard.

Text shown in *bold italics* in this amendment defines the editing instructions necessary in order to incorporate the modifications and additions into the base text. Three editing instructions are used: *change*, *delete*, and *insert*. *Change* is used to make a change to existing material. The editing instruction specifies the location of the change and describes what is being changed either by using ~~strike through~~ (to remove old material) or underscore (to add new material). *Delete* removes existing material. *Insert* adds new material without changing the existing material. Insertions may require renumbering. If so, renumbering instructions are given in the editing instruction. Editorial notes will not be carried over into future editions of IEEE Std 802.

Change the Abstract and Keywords in the front matter of IEEE Std 802-2001 as follows:

Abstract: IEEE Std 802-2001, IEEE Standard for Local and Metropolitan Area Networks: Overview and Architecture, provides an overview to the family of IEEE 802 standards. It describes the relationship of the IEEE 802 standards to the Open Systems Interconnection Basic Reference Model [ISO/IEC 7498-1:1994] and explains the relationship of these standards to the higher layer protocols; it provides a standard for the structure of LAN MAC addresses; it provides a standard for identification of public, private, prototype, and standard protocols; and it defines an Object Identifier hierarchy used within IEEE 802 for uniform allocation of Object Identifiers used in IEEE 802 standards.

Keywords: IEEE 802 Local Area Networks (LANs), LAN/MAN architecture, LAN/MAN reference model, Metropolitan Area Networks (MANs), Protocol development, Ethernets, Object Identifiers.

1. Scope

1.1 General

Change the text of subclause 1.1 as shown below:

This document serves as the foundation for the family of IEEE 802 standards published by IEEE for Local Area Networks (LANs) and Metropolitan Area Networks (MANs). It contains descriptions of the networks considered as well as a reference model (RM) for protocol standards. A standard for the identification of public, private, prototype, and standard protocols is included, using either Ethertype values or LLC addresses. An Object Identifier hierarchy is defined, for use within IEEE 802 to ensure uniform allocation of Object Identifiers within IEEE 802 standards.

2. References

Add the following reference to Clause 2, References:

ISO/IEC 8824:1990, Information technology—Open systems interconnection—Specification of Abstract Syntax Notation One (ASN.1)

Insert the following clause as a new Clause 13:

13. Allocation of Object Identifier values in IEEE 802 standards

From time to time, various IEEE 802 standards have a requirement to allocate Object Identifier values—the most common example being for the purpose of defining SNMP MIBs, but other examples exist. This clause defines a simple and consistent Object Identifier hierarchy, based on the use of the Object Identifier value that has been assigned by ISO to identify the ISO/IEC 8802 series of standards. This hierarchy can be used by all current and future IEEE 802 Working Groups, and can be used flexibly to meet the needs of the standards defined by those working groups. This will establish a consistent practice within IEEE 802 for the development and allocation of object identifiers. Consistency of Object Identifier allocation will facilitate implementation and operation of IEEE 802 compliant equipment.

13.1 Object Identifiers and ISO standards

An Object Identifier is an ASN.1 data type that is used as a means of defining unique identifiers for objects. Values of the Object Identifier data type can then be used to name the objects to which they relate.

The Object Identifier data type consists of a sequence of one or more non-negative integers, often referred to as arcs, that define a hierarchy, or tree, of object identifier values. The first arc in the sequence identifies the registration authority responsible for allocating the values of the second and subsequent arcs. For example:

iso(1)

indicates that an initial arc value of 1 identifies ISO as the registration authority. Subsequent arcs in the sequence will have been determined by ISO, or will have been allocated by registration authorities subordinate to ISO.

Under the iso arc, a second arc of zero has been allocated to identify standards; hence, the two-integer sequence

iso(1) std(0)

indicates that the third integer is used to identify a particular ISO standard. The actual standard number is used in the third arc; hence:

iso(1) std(0) iso8802(8802)

identifies ISO/IEC 8802.

The responsibility for allocating the fourth and subsequent arcs under iso(1) std(0) iso8802(8802) lies with the standard concerned.

As ISO/IEC 8802 is the ISO/IEC standard number used to identify the ISO/IEC versions of the family of IEEE 802 LAN/MAN standards, this particular sequence of integer values can form the basis of an Object Identifier hierarchy for use by the individual standards in the 8802 family. The act of assigning an ISO standard number to a standard has the effect of automatically assigning an OID arc to that standard, and therefore no further administrative effort is needed before that standard can allocate OID values under that point in the tree, using the fourth and subsequent arcs.

The iso(1) std(0) iso8802(8802) arc assignment can be used by all members of the family of IEEE 802 standards, without regard to whether or not IEEE 802.n standards are forwarded to ISO/IEC for international standardization in the 8802 series.

13.2 The Object Identifier hierarchy under iso(1) std(0) iso8802(8802)

The Object Identifier value assigned to the 8802 series of standards is:

iso(1) std(0) iso8802(8802)

The next arc in the sequence shall be used to differentiate between members of the IEEE 802 family of standards, by using it as a working group designator, as follows:

iso(1) std(0) iso8802(8802) ieee802dotXX(XX)

where XX is the working group number of the IEEE 802 Working Group responsible for that standard. These arcs are assigned for use in all current and future IEEE 802.XX standards, without regard to whether or not those standards are forwarded to ISO/IEC for international standardization in the 8802 series.

For example, under this hierarchy, the value used within the standards defined by the IEEE 802.1™ Working Group is:

iso(1) std(0) iso8802(8802) ieee802dot1(1)

and the value used within the IEEE 802.3™ standards is:

iso(1) std(0) iso8802(8802) ieee802dot3(3)

The working group concerned is free to decide how further arcs will be allocated within their standards, in a manner that makes sense for their particular needs. For example, in the IEEE 802.1 Working Group, the fifth

arc is used to define the type of allocations that are being made. The only type defined so far is for MIBs, but others can be added in the future:

```
iso(1) std(0) iso8802(8802) ieee802dot1(1) ieee802dot1mibs(1)
```

Below this arc, each individual IEEE 802.1 MIB can get its own identifier. Again, only IEEE 802.1X's MIB (ieee8021paeMIB) appears in this scheme so far, but clearly others can easily be added:

```
iso(1) std(0) iso8802(8802) ieee802dot1(1) ieee802dot1mibs(1) ieee8021paeMIB(1)
```

It is the responsibility of each working group to ensure that any values that are allocated to the fifth and subsequent arcs are documented, in a manner that ensures that the same OID value cannot be assigned to two different objects. In the IEEE 802.1 Working Group, this has been achieved in the past by placing tables of OID allocations in an annex within the standard concerned; in the IEEE 802.3 Working Group, a master spreadsheet of allocated OID values is maintained by the Chair and posted on their website. For future allocations, adopting a master spreadsheet approach is appropriate.

It is important that the allocation scheme for the fifth and subsequent arcs is constructed in a manner that leaves appropriate "escapes" for uses that cannot be foreseen. The simple expedient of allocating a "type of allocation" value as the fifth arc (as in the IEEE 802.1 Working Group usage described above) is sufficient to ensure that such an escape is always available.

13.3 Migration from previous Object Identifier allocations

The Object Identifier hierarchy described in this clause need not have any effect upon existing IEEE 802 standards that have already solved this problem by using a specific allocation obtained elsewhere (for example, from ANSI). The primary aims of documenting this procedure are:

- a) To ensure that Object Identifiers can be allocated under iso(1) std(0) iso8802(8802) in a manner that ensures that they are unique, and
- b) To avoid the need for any further administrative overhead (such as applying for the use of an Object Identifier arc) for any future uses of Object Identifiers in IEEE 802 standards.

With the hierarchy as defined in this clause, as new working groups are created in IEEE 802, their base Object Identifier arc is also created automatically, so no administrative effort is required on the part of the working group, other than to determine how the fifth and subsequent arcs will be used in their standards.

For those working groups that have already made use of other allocation schemes (IEEE 802.3 and IEEE 802.1 are both examples), it may be considered appropriate to migrate existing allocations to the hierarchy defined in this clause. In considering this, the following should be borne in mind:

- c) While it might be perceived as "tidy" to have all IEEE 802 Object Identifiers allocated under a single arc of the Object Identifier tree, this is not a requirement for any other reason; one Object Identifier value is no better or no worse than any other from a technical point of view, as long as any given Object Identifier identifies a single object.
- d) If migration is desired, there is no requirement to remove the old Object Identifier values; indeed, this is not permitted for objects defined in SNMP MIB modules, nor is it permitted to associate such objects with more than one Object Identifier value. Instead, new definitions shall be created and registered under the desired Object Identifier tree.
