ANSI®
C29.9-1983
Revision of
ANSI C29.9-1971

American National Standard for Wet-Process Porcelain Insulators – Apparatus, Post-Type

Secretariat

National Electrical Manufacturers Association
Institute of Electrical and Electronics Engineers

Approved December 14, 1982

American National Standards Institute, Inc

American National Standard

An American National Standard implies a consensus of those substantially concerned with its scope and provisions. An American National Standard is intended as a guide to aid the manufacturer, the consumer, and the general public. The existence of an American National Standard does not in any respect preclude anyone, whether he has approved the standard or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standard. American National Standards are subject to periodic review and users are cautioned to obtain the latest editions.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of approval. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

Foreword

(This Foreword is not a part of American National Standard C29.9-1983.)

The first edition of this standard was based essentially on the EEI-NEMA (Edison Electric Institute-National Electrical Manufacturers Association) Standards for Wet-Process Porcelain Insulators (Apparatus, Post-Type), EEI TDJ-59, NEMA 147-1956. It was developed by the American National Standards Committee on Insulators for Electric Power Lines, C29.

This standard has been revised three times by the C29 Committee. This third revision (1) makes numerous editorial changes deemed to improve clarity; (2) removes porcelain color as a requirement; (3) changes the test description for ferrous metal parts galvanizing; (4) moves packing requirements to an appendix; (5) requires electrical tests to be made on completely assembled insulators; (6) revises the mechanical proof test requirements; (7) increases routine tension test values to 50 percent of rating; and (8) adds optional routine cantilever and bending movement tests.

Suggestions for improvement of this standard will be welcome. They should be sent to the National Electrical Manufacturers Association, 2101 L Street, NW, Washington, D.C. 20037.

This standard was processed and approved for submittal to ANSI by American National Standards Committee on Insulators for Electric Power Lines, C29. Committee approval of the standard does not necessarily imply that all committee members voted for its approval. At the time it approved this standard, the C29 Committee had the following members:

O. Compton, Chairman
C. H. White, Secretary

American National Standard for Wet-Process Porcelain Insulators Apparatus, Post-Type

1. Scope

This standard covers outdoor high-voltage post-type apparatus insulators made of wet-process porcelain and used in the transmission and distribution of electrical energy.

2. Definitions

2.1 See Section 2 of American National Standard Test Methods for Electrical Power Insulators, ANSI C29.1-1982, for definitions of terms.

2.2 In this standard the word "insulator" shall refer to a unit or to a stack of two or more units.

2.3 The technical reference numbers appearing in tables are a widely used and recognized identification series for apparatus insulator units or stacks.

3. General

3.1 Insulators shall conform to all respects to the requirements hereinafter stated. The text and tables supplement each other and shall be considered as part of this standard.

3.2 Some insulators are tapered and may contain units that have certain characteristics whose strengths exceed those given in the tables. Each unit shall comply with the manufacturer's strength requirements.

3.3 Manufacturers' drawings, if furnished, shall show the outline of the insulators, together with all pertinent dimensions. Any variations in these dimensions due to manufacturing tolerances shall be indicated.

4. Material

4.1 Insulators shall be made of good commercial grade wet-process porcelain.

4.2 The entire porcelain surface of the insulators that will be exposed after assembly shall be glazed. The entire porcelain surface shall be relatively free from imperfections. Color is not a part of this standard. If gray is required, it shall be in accordance with American National Standard Gray Finishes for Industrial Apparatus and Equipment, ANSI Z55.1-1967 (R1973), and conform to Munsell notation 5BG 7.0/0.4 with the following tolerances:

(1) Hue: ± 12 (3G to 7B)
(2) Color: ± 0.5
(3) Chroma: −0.2 to + 0.6

4.3 Metal parts shall be made of a good commercial grade of malleable iron, ductile iron, or steel. Ferrous parts other than stainless steel shall be galvanized in accordance with Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware, ASTM A153-80.[1]

5. Dimensions and Characteristics

5.1 Dimensions and characteristics of the insulators shall be in accordance with Tables 1 and 2 and Figure 1.

5.2 Shell diameters given for the insulators listed in Table 1 shall not be exceeded by more than three percent to ensure physical clearances in assembled apparatus.

5.3 Minimum dimensions are limited by other specified characteristics.

[1] Copies are available from ASTM, 1916 Race Street, Philadelphia, PA 19103.

6. Marking

Each insulator unit shall bear symbols identifying the manufacturer and giving the year of manufacture. The marking shall be legible and durable.

7. Samples, Inspection, and Tests

7.1 General. Tests described in 7.2 shall be required only on insulators of new designs. Tests described in 7.3 shall be required on each lot of insulators. Tests described in 7.4 shall be made on each insulator. Electrical tests described in 7.2 shall be conducted on completely assembled insulators.

7.2 Design Tests

7.2.1 Low-Frequency Wet Withstand. Three insulators shall be selected at random and tested in accordance with 4.5 of ANSI C29.1-1982. Failure of any insulator to meet the rated wet withstand value, as given in the applicable table, shall constitute failure to meet the requirements of this standard.

7.2.2 Critical-Impulse Flashover, Positive. Three insulators shall be selected at random and tested in accordance with 4.7 of ANSI C29.1-1982. Failure of the average critical-impulse flashover value of the three insulators to equal or exceed 92 percent of the rated critical-impulse flashover value, as given in the applicable table, shall constitute failure to meet the requirements of this standard.

7.2.3 Impulse Withstand. Three insulators shall be selected at random and tested in accordance with 4.8 of ANSI C29.1-1982. Failure of any insulator to meet the rated impulse-withstand value, as given in the applicable table, shall constitute failure to meet the requirements of this standard.

7.2.4 Radio-Influence Voltage (RIV). Three insulators shall be selected at random and tested in accordance with 4.9 of ANSI C29.1-1982. If one or more insulators fail to meet the requirements given in the applicable table, three additional insulators shall be selected at random and tested. Failure of one or more of these additional insulators shall constitute failure to meet the requirements of this standard.

7.2.5 Thermal Shock. Three insulators shall be selected at random and tested for ten complete cycles in accordance with 5.5 of ANSI C29.1-1982. For multiunit insulators, three of each type of unit in the stack shall be tested. The temperature of the hot-water bath shall be approximately 150°F (66°C) and the temperature of the cold-water bath shall be approximately 39°F (4°C). At the end of the tenth cycle, the test specimens shall be checked for electrical soundness. If one insulator fails, three additional insulators shall be selected at random and tested. Failure of more than one insulator from the first sample, or from the first and second samples combined, shall constitute failure to meet the requirements of this standard.

7.2.6 Compression Strength. Three insulators shall be selected at random and tested in accordance with 5.1.4.4 of ANSI C29.1-1982. For multiunit insulators, three of each type of unit in the stack shall be tested. Failure of the average strength of the three insulators or units to meet the strength requirements given in the tables or to meet the specified higher strength requirement, where applicable, or failure of any one insulator or unit to equal 85 percent of that strength requirement shall constitute failure to meet the requirements of this standard.

7.2.7 Torsional Strength. Three insulators shall be selected at random and tested in accordance with 5.1.4.2 of ANSI C29.1-1982. For multiunit insulators, three of each type of unit in the stack shall be tested. Failure of the average strength of the three insulators or units to meet the strength requirements given in the tables or to meet the specified higher strength requirement, where applicable, or failure of any one insulator or unit to equal 85 percent of that strength requirement shall constitute failure to meet the requirements of this standard.

7.3 Quality Conformance Tests[2]

7.3.1 Visual and Dimensional Tests. Conformity with 4.2 may be determined by visual inspection. All insulators not conforming to 4.2 fail to meet the requirements of this standard.

Three insulators shall be selected at random from the lot and their dimensions checked against the dimensions of the manufacturer's drawing. Failure of more than one of these insulators to conform to the dimensions on the drawing shall constitute failure of the lot to meet the requirements of this standard.

7.3.2 Porosity. Test specimens shall be selected from insulators destroyed in other tests and tested in accordance with 5.4 of ANSI C29.1-1982. Penetration of the dye into the body of the dielectric shall constitute failure of the lot to meet the requirements of this standard.

7.3.3 Galvanizing Test. Five pieces representative of each type of galvanized hardware used with the insulators shall be selected at random and tested in ac-

[2] Substantial experience indicates that a total of one-half percent of the number of insulators in the lot is sufficient to establish characteristics demonstrable by destructive tests.

cordance with Section 6 of ANSI C29.1-1982. Five to ten measurements shall be uniformly and randomly distributed over the entire surface. The average thickness value for each individual specimen and the average of the entire sample shall equal or exceed the following:

Hardware	*Average of Entire Sample*	*Average of Individual Specimen*
Hardware (except nuts/bolts)	3.4 mil	3.1 mil
Nuts/bolts	2.1 mil	1.7 mil

If the average of one specimen, or if the average of the entire sample, fails to comply with the above, ten additional pieces of the same type of hardware shall be selected at random and tested. Failure of the retest sample to comply with the minimum thickness criteria shall constitute failure of the lot to meet the requirements of this standard.

7.3.4 Cantilever Strength. Three insulators shall be selected at random and tested in accordance with 5.1.4.1 of ANSI C29.1-1982. For multiunit insulators, three of each type of unit in the stack shall be tested. The units may be tested in a stack or individually. Failure of the average strength of the three insulators or units to meet the strength requirements given in the tables or to meet the specified higher strength requirement, where applicable, or failure of any one insulator or unit to equal 85 percent of that strength requirement shall constitute failure to meet the requirements of this standard.

7.3.5 Tensile Strength. Three insulators shall be selected at random and tested in accordance with 5.1.4.3 of ANSI C29.1-1982. For multiunit insulators, three of each type of unit in the stack shall be tested. Failure of the average strength of the three insulators or units to meet the strength requirements given in the tables or to meet the specified higher strength requirement, where applicable, or failure of any one insulator or unit to equal 85 percent of that strength requirement shall constitute failure to meet the requirements of this standard.

7.4 Routine Tests

7.4.1 Flashover. Each hollow-core insulator unit shall be subjected to a routine flashover test before assembly in accordance with 7.1 of ANSI C29.1-1982. For this test, an electrode shall be placed on each side of, and adjacent to, the porcelain barrier. All units that puncture fail to meet the requirements of this standard.

7.4.2 Mechanical Proof

7.4.2.1 Each insulator of the type given in Table 1 shall be subjected to one of the following tests.

(1) A tension test in accordance with 5.1.4.3 of ANSI C29.1-1982. The load applied shall be not less than 50 percent of the tension strength shown in the table.

(2) A cantilever test in accordance with 5.1.4.1 of ANSI C29.1-1982. The load applied shall be not less than 40 percent of the cantilever strength shown in the table. The test shall be performed in each of the four quadrants.

Successful completion of either the tension test or cantilever test shall constitute demonstration of conformance with the requirements of this standard.

7.4.2.2 Each insulator of the type given in Table 2 shall be subjected to one of the following tests.

(1) A tension test in accordance with 5.1.4.3 of ANSI C29.1-1982. The load applied shall be not less than 50 percent of the tensile strength shown in the table.

(2) A cantilever test in accordance with 5.1.4.1 of ANSI C29.1-1982. The load applied shall be not less than 40 percent of the cantilever strength shown in table. The test shall be performed in each of the four quadrants.

(3) A bending moment test in which the bending moment simultaneously loads each end of the unit in proportion to the unit rating. The test shall be repeated in each of the four quadrants. The proof test moment shall be not less than 40 percent of the bending moment rating of the unit.

Successful completion of either the tension test or the cantilever test or the bending moment test shall constitute demonstration of conformance with the requirements of this standard. A unit rated higher than the stack in which it is contained shall be tested at 50 percent of the tension rating of the unit or at 40 percent of the cantilever or bending moment rating of the unit, as applicable.

8. Referenced American National Standards

When the following American National Standards referred to in this document are superseded by a revision approved by the American National Standards Institute, Inc, the revision shall apply:

American National Standard Test Methods for Electrical Power Insulators, ANSI C29.1-1982

American National Standard Gray Finishes for Industrial Apparatus and Equipment, ANSI Z55.1-1967 (R1973)

*The following bolt circles, when tapped, shall be:

3-inch bolt circle – 4 tapped holes,1/2 inch – 13 unified form special
Pitch Diameter 0.4715–0.4650
Length of engagement, 0.50 (tap after hot dip galvanizing)

5-inch bolt circle – 4 tapped holes, 5/8 inch – 11 unified form special
Pitch Diameter 0.5882–0.5810
Length of engagement, 0.625 (tap after hot dip galvanizing)

NOTE: Metric Conversions –

1 inch = 25.4 mm, rounded off to the nearest whole number for dimensions greater than or equal to 1 inch. For dimensions less than 1 inch, round off to the nearest tenth.

1 pound = 4.448 newtons, rounded off to the nearest whole number.

Inch-pound = 0.113 newton-meters, rounded off to the nearest whole number.

*The following bolt circles, when tapped, shall be:

5-inch bolt circle – 4 tapped holes, 5/8 inch – 11 unified form special
Pitch Diameter 0.5882–0.5810
Length of engagement, 0.625 (tap after hot dip galvanizing)

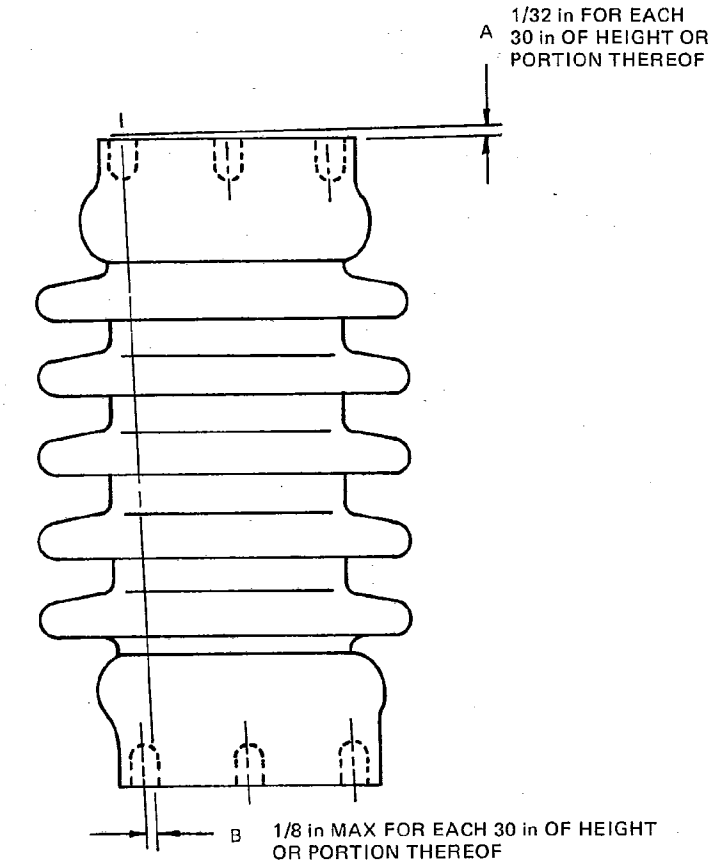
7-inch bolt circle – 4 tapped holes, 3/4 inch – 10 unified form special
Pitch Diameter 0.7077–0.7000
Length of engagement, 0.75 (tap after hot dip galvanizing)

NOTE: Metric Conversions –

1 inch = 25.4 mm, rounded off to the nearest whole number for dimensions greater than or equal to 1 inch. For dimensions less than 1 inch, round off to the nearest tenth.

1 pound = 4.448 newtons, rounded off to the nearest whole number.

Inch-pound = 0.113 newton-meters, rounded off to the nearest whole number.



NOTES:
(1) All dimensions are measured at bolt circle.
(2) Tolerance applies to individual units.

Figure 1
Tolerances

Appendixes

(These Appendixes are not a part of American National Standard C29.9-1983, but are included for information only.)

Appendix A
Packing

Packaging of insulators should be such as to afford reasonable and proper protection to the insulators in shipping and handling.

Each box or container should be marked with: the number of pieces contained therein; the catalog number, or class number, or description of the contents; and the manufacturer's name.

Appendix B
Additional Electrical Design Tests

In the following additional electrical design tests are required, the procedure given in this Appendix may prove to be useful.

B1. Low-Frequency Dry Flashover

Three insulators should be selected at random and tested in accordance with 4.2 of ANSI C29.1-1982. The average dry-flashover value of the three insulators should be equal to or exceed 95 percent of the rated dry-flashover value of the insulator.

B2. Low-Frequency Wet Flashover

Three insulators should be selected at random and tested in accordance with 4.3 of ANSI C29.1-1982. The average wet-flashover value of the three insulators should be equal to or exceed 90 percent of the rated wet-flashover value of the insulators.

B3. Critical Impulse Flashover – Negative

Three insulators should be selected at random and tested in accordance with 4.7 of ANSI C29.1-1982. The average critical impulse flashover, negative, value of the three insulators should be equal to or exceed 92 percent of the rated critical impulse flashover, negative, value of the insulators.

American National Standards

The standard in this booklet is one of more than 10,000 standards approved to date by the American National Standards Institute.

The Standards Institute provides the machinery for creating voluntary standards. It serves to eliminate duplication of standards activities and to weld conflicting standards into single, nationally accepted standards under the designation "American National Standards."

Each standard represents general agreement among maker, seller, and user groups as to the best current practice with regard to some specific problem. Thus the completed standards cut across the whole fabric of production, distribution, and consumption of goods and services. American National Standards, by reason of Institute procedures, reflect a national consensus of manufacturers, consumers, and scientific, technical, and professional organizations, and governmental agencies. The completed standards are used widely by industry and commerce and often by municipal, state, and federal governments.

The Standards Institute, under whose auspices this work is being done, is the United States clearinghouse and coordinating body for voluntary standards activity on the national level. It is a federation of trade associations, technical societies, professional groups, and consumer organizations. Some 1000 companies are affiliated with the Institute as company members.

The American National Standards Institute is the United States member of the International Organization for Standardization (ISO) and the International Electrotechnical Commission (IEC). Through these channels U.S. standards interests make their positions felt on the international level. American National Standards are on file in the libraries of the national standards bodies of more than 60 countries.
