ITU-T RECOMMENDATION M.1380

BRINGING-INTO-SERVICE OF INTERNATIONAL LEASED CIRCUITS THAT ARE SUPPORTED BY INTERNATIONAL DATA TRANSMISSION SYSTEMS

Summary

This Recommendation is only applicable to international leased circuits that are supported by an international data transmission system.

The requirements described in this Recommendation should ensure that an international leased circuit meets performance expectations and is fully tested prior to introduction into service.

The bringing-into-service tests described in this Recommendation should ideally include periods of normal industrial activity to be representative of typical network conditions.

This Recommendation has been developed to be consistent with Recommendation M.1370 [10] that describes the bringing-into-service of international data transmission systems.

Recommendation M.1385 [11] covers maintenance issues for international leased circuits that are supported by an international data transmission system.

This Recommendation addresses the bringing-into-service requirements of leased circuits with a digital presentation at renters' premises. For circuits with an analogue presentation, the bringing-into-service procedures given in Recommendation M.1050 [7] apply, with performance achievement in accordance with Recommendations M.1020 [3], M.1025 [4] or M.1040 [5] as appropriate.

FOREWORD

ITU (International Telecommunication Union) is the United Nations Specialized Agency in the field of telecommunications. The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of the ITU. The ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Conference (WTSC), which meets every four years, establishes the topics for study by the ITU-T Study Groups which, in their turn, produce Recommendations on these topics.

The approval of Recommendations by the Members of the ITU-T is covered by the procedure laid down in WTSC Resolution No. 1.

In some areas of information technology which fall within ITU-T's purview, the necessary standards are prepared on a collaborative basis with ISO and IEC.

NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

INTELLECTUAL PROPERTY RIGHTS

The ITU draws attention to the possibility that the practice or implementation of this Recommendation may involve the use of a claimed Intellectual Property Right. The ITU takes no position concerning the evidence, validity or applicability of claimed Intellectual Property Rights, whether asserted by ITU members or others outside of the Recommendation development process.

As of the date of approval of this Recommendation, the ITU had/had not received notice of intellectual property, protected by patents, which may be required to implement this Recommendation. However, implementors are cautioned that this may not represent the latest information and are therefore strongly urged to consult the TSB patent database.

Recommendation M.1380

BRINGING-INTO-SERVICE OF INTERNATIONAL LEASED CIRCUITS THAT ARE SUPPORTED BY INTERNATIONAL DATA TRANSMISSION SYSTEMS

(Helsinki, 1993; revised in 1997)

1 Scope

This Recommendation describes the bringing-into-service procedures for an international leased circuit that is supported by an international data transmission system. The circuit will have a digital presentation, in the PDH domain, at the customer's premises.

This Recommendation does not cover the bringing-into-service requirements of leased circuits with an analogue presentation at the customer's premises. Such circuits are described in Recommendation M.1050.

2 References

The following ITU-T Recommendations and other references contain provisions which, through reference in this text, constitute provisions of this Recommendation. All Recommendations are subject to revision; all users of this Recommendation are therefore encouraged to investigate the possibility of applying the most recent edition of the Recommendations listed below. 3   Terminology and definitions

Recommendation M.1300 [8] provides general descriptions of international data transmission systems.

Terminology and definitions relating to this Recommendation are provided in Recommendation M.60 [1].

4   Performance limits and objectives

Performance limits for the international section should be consistent with those given in Recommendation M.1340 [9]. For all performance tests described in this Recommendation, the Errored Second (ES) and Severely Errored Second (SES) limits should be met simultaneously for the test result to be considered acceptable.

For the national circuit sections, limits will be set independently by the Administrations involved taking account of local conditions. Performance achievement will clearly be dependent upon the performance and topology of the local transmission facilities. To maintain consistency with Recommendation M.1340 [9], Administrations should use errored seconds and severely errored seconds parameters to measure performance achievement.

The possible development and application of performance objectives for transmission delay is left for further study.

All test results obtained during bringing-into-service tests should be retained for future reference during maintenance activities.

5 Preliminary exchange of information

Consideration should be given to information that has already been exchanged for the international data transmission system that will support service. See clause 2/M.1370 [10].

Circuit information should be exchanged in accordance with Recommendation M.1045 [6]. In addition, Administrations may find that it is advantageous to exchange the following information:

a) details of any special maintenance or fault reporting arrangements that have been requested (e.g. single end fault reporting);

b) contact details for, and operational arrangements with, any additional Administrations that are involved with the provision of service (e.g. Administrations that provide a transit routing facility);

c) precise details of the interface presentation and functionality at the renter's premises (this should ideally be in accordance with existing Recommendations, e.g. V.11 [13], X.21 [18], V.24 [14], V.28 [15], V.36 [16], V.110 [17], G.703 [19]);

d) performance limits for the national sections (see below) and for the overall circuit;

e) confirmation of the data rate presented at the customer interface where this is different to the data rate extended internationally (e.g. application of Recommendation G.702 [20] for the support of 1544 kbit/s circuits within a 2048 kbit/s transmission hierarchy);

f) details of any equipment loopback capabilities that may be available;

g) details of escalation arrangements and contacts that may be used to overcome operational difficulties (see Recommendation M.1560 [12]).

Administrations should confirm that the information exchanged is consistent and that the circuit will be able to support service.

The information that has been exchanged, as detailed above, should be retained for future reference.

6 Bringing-into-service procedures

It is normal practice to set up the national circuit sections prior to attempting to test the international section.

Suitable performance limits for the national circuit sections should be developed and exchanged between the Administrations involved [see item d) of clause 5 above].

When the national circuit sections have been provided and successfully tested, the international section (international data transmission system channel) should be tested. If in-service performance monitoring is available, and the error performance of the international data transmission system is acceptable, all new circuits should be tested for 15 minutes. In the case where a number of circuits are brought into service at the same time, and in-service performance monitoring is not available, the first circuit should be tested for 24 hours, and the remaining circuits could be tested for 15 minutes each. The objectives given in clause 4/M.1340 [9] should be met. Where there is little confidence regarding the capabilities of a particular international data transmission system, or where the short duration test objectives were not met, a 24-hour test should be performed using the limits that were originally developed to test the international data transmission system (see clause 3/ M.1370 [10]). In the event that the 24 hour limits are not met, Administrations should agree to an appropriate course of action (see Recommendation M.1375 [2] for guidance).

Any portions of the circuit which are not supported by the international data transmission system should be tested for 24 hours.

Where the international section extends significantly beyond the channel interfaces of a particular international data transmission system (e.g. where a transit routing involves the interconnection of two international data transmission systems), additional tests may be required. Administrations should ensure that all parts of the international section are fully tested. Suitable additional limits should be agreed between the Administrations involved. Consistency with Recommendation M.1340 [9] should be sought wherever possible.

It will normally be advantageous to perform an end-to-end test to confirm overall integrity and stability. A 24-hour test duration is recommended. Test limits should include allowances for the international and two national circuit sections. Administrations should pay particular attention to highlighting any problems that may be associated with the interworking of separately timed networks, especially for the first circuit provision that uses a particular equipment configuration.

Dependent upon the loopback capabilities provided by the network terminating equipments at the renter's premises, it may be possible to perform end-to-end tests from intermediate points within the network (e.g. at terminal international centres).

Where loop tests are employed, it is proposed that no special additional performance allowance is made (i.e. doubling of limits is not recommended).
