V.56

**DATA COMMUNICATION OVER THE TELEPHONE
NETWORK**

**COMPARATIVE TESTS OF MODEMS FOR
USE OVER TELEPHONE-TYPE CIRCUITS**

ITU-T Recommendation V.56

(Extract from the *Blue Book*)

NOTES

1 ITU-T Recommendation V.56 was published in Fascicle VIII.1 of the *Blue Book*. This file is an extract from the *Blue Book*. While the presentation and layout of the text might be slightly different from the *Blue Book* version, the contents of the file are identical to the *Blue Book* version and copyright conditions remain unchanged (see below).

2 In this Recommendation, the expression “Administration” is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

Recommendation V.56

**COMPARATIVE TESTS OF MODEMS FOR USE OVER
TELEPHONE-TYPE CIRCUITS**

*(Geneva, 1972; amended at Geneva, 1976 and 1980,
Malaga-Torremolinos, 1984 and at Melbourne, 1988)*

To facilitate the work of Administrations in making comparative tests of modems for use over telephone-type circuits offered by different manufacturers, it is recommended that the tests should be made in the laboratory under the following operating conditions:

1 List of test parameters (see Table 1/V.56)

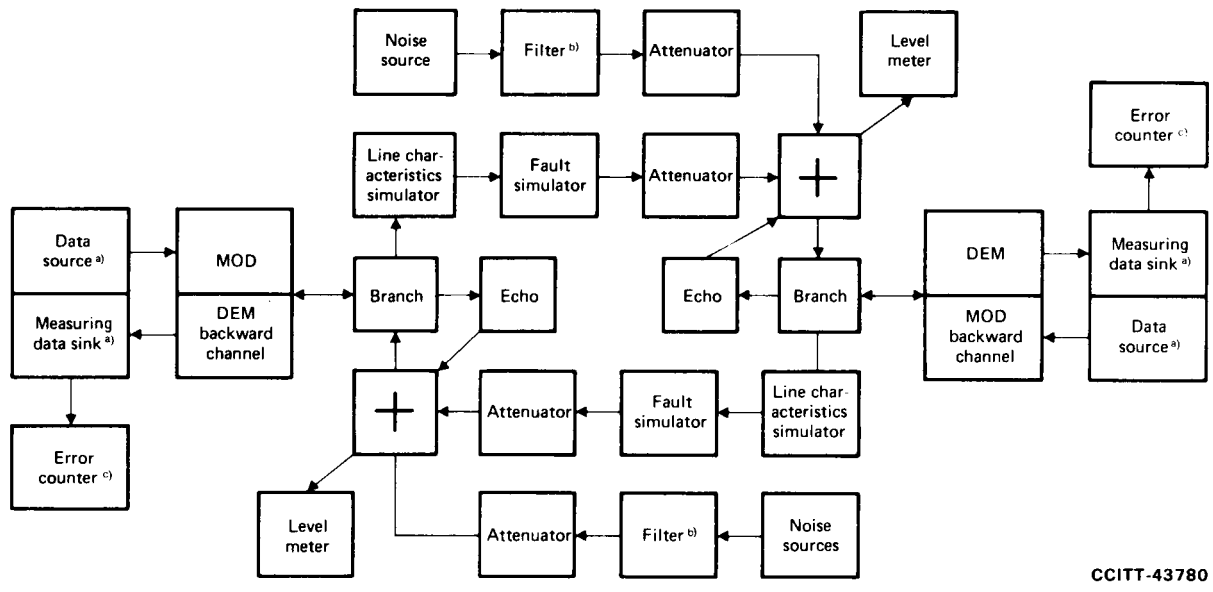

TABLE 1/V.56

Test parameters

Ref. No.	Parameter	Four-wire point-to-point	Two-wire switched network	
			Serial modems	Parallel modems
1	Total attenuation or receiving signal level	X	X	
2	Attenuation distortion	X	X	
3	Envelope or group delay distortion	X	X	
4	Frequency shift (or offset)	X	X	
5	Sudden changes of attenuation	X	X	
6	Interruptions	X	X	
7	Phase hits	X	X	
8	Phase jitter	X	X	
9	Harmonic distortion	X	X	X
10	Listener echo		X	
11	"White" noise	X	X	
12	Impulsive noise	X	X	
13	Single tone interference		X	

2 Block diagram for standard test measuring set-up

It is proposed that comparative tests be made using either all or parts of the measuring set-up shown in Figure 1 /V.56.

a) 511-bit pseudo random text.
 b) 300-3400-Hz band pass filter; the filter is left out if impulsive noise in the form of a square wave is used.
 c) For bit and block error count, see Recommendation V.52.

FIGURE 1/V.56
Measuring set-up for the standard tests of modems

3 Test parameters

3.1 *Parameters of the line characteristics simulator*

3.1.1 *Symmetric line distortion*

See Tables 2/V.56 and 3/V.56. The tolerances for all values are $\pm 5\%$.

3.1.2 *Asymmetric line distortion*

See Tables 4/V.56 and 5/V.56. The tolerances for all values are $\pm 5\%$.

3.1.3 *Ripple distortion*

The ripple distortion is within the tolerance scheme of Recommendation M.1020 [1]. See Tables 6/V.56 and 7/V.56. The tolerances for all values are $\pm 5\% \pm 0.1$ ms.

TABLE 2/V.56

Frequency (Hz)	Attenuation distortion (dB)		
	Mode 1 (see Note 1)	Mode 2 (see Note 2)	Mode 3 (see Note 5)
300	6	12	K_1 b)
500	3	8	$0.35 K_1$
800	1	2 a)	0
≈ 1600	0	0	0
2500	Unspecified	8	$0.2 K_1$
2800	3	Unspecified	$0.3 K_1$
3000	6	12	$0.4 K_1$

a) To be clarified.
 b) K_1 is a multiplier with values 1, 2, 3, 4, 5, 6 and 7.

TABLE 3/V.56

Frequency (Hz)	Attenuation distortion (dB)		
	Mode 1 (see Note 1)	Mode 2 (see Note 2)	Mode 3 (see Note 5)
500	3	4.5	1.20 K ₁ ^{a)}
600	1.5	3	1.90 K ₁
1000	0.5	1.5	0.32 K ₁
≈ 1800	0	0	0
2600	0.5	1.5	0.12 K ₁
2800	3	3	0.23 K ₁
2900	Unspecified	4	0.31 K ₁
3000	Unspecified	Unspecified	0.40 K ₁

a) K₁ is a multiplier with values 1, 2, 3, 4, 5, 6 and 7.

TABLE 4/V.56

Frequency (Hz)	Attenuation distortion (dB)		
	Mode 1 (see Note 1)	Mode 2 (see Note 2)	Mode 3 (see Note 5)
800	0	0	0
2000	0.75	Unspecified	Unspecified
2500	Unspecified	8	8 K ₂ ^{a)}
2800	3	Unspecified	Unspecified
3000	6	12	12 K ₂

a) K₂ is a multiplier with values 0.4, 0.8, 1.2 and 1.6.

TABLE 5/V.56

Frequency (Hz)	Group-delay distortion (ms)		
	Mode 1 (see Note 1)	Mode 2 (see Note 2)	Mode 3 (see Note 5)
500	0	0	0
1900	Unspecified	Unspecified	0.075 K ₃ ^{a)}
2600	0.5	1.5	Unspecified
2800	3	3	0.225 K ₃
2900	Unspecified	4	Unspecified
3000	Unspecified	Unspecified	0.30 K ₃

a) K₃ is a multiplier with values 0.5, 1, 2, 4 and 8. All values of Mode 3 are provisional.

TABLE 6/V.56

Frequency (Hz)	Group-delay distortion (ms)
	Mode 1
500	2.0
600	1.3
1000	0 (see Note 3)
1400	0.5 (see Note 4)
1800	0 (see Note 3)
2200	0.5 (see Note 4)
2600	0.3 (see Note 3)
2800	2.0

TABLE 7/V.56

Frequency (Hz)	Group-delay distortion (ms)
	Mode 2
500	2.0
600	0,8
800	0.8 (see Note 4)
1000	0 (see Note 3)
1200	0.5 (see Note 4)
1400	0 (see Note 3)
1600	0.5 (see Note 4)
1800	0 (see Note 3)
2000	0.5 (see Note 4)
2200	0 (see Note 3)
2400	0.5 (see Note 4)
2600	0.3 (see Note 3)
2800	2.0

Notes to Tables 2/V.56 to 7/V.56

Note 1 - Mode 1 is in conformity with Recommendation M.1020 [1].

Note 2 - Mode 2 is in conformity with Recommendation M.1025 [2].

Note 3 - Ripple valley values (minima).

Note 4 - Ripple peak values (maxima).

Note 5 - Mode 3 is in conformity with the relevant European specifications.

3.2 *Parameters of the fault simulator*

- a) Phase hits: with external control of timing (e.g. 0.25; 1; 100 Hz) adjustable continuously or in steps up to 165 degrees.

- b) Frequency shifts e.g. ± 5 Hz, ± 6 Hz or ± 10 Hz by means of channel converters.
- c) Peak-to-peak phase jitter from 0.2 degree to 30 degrees continuously from 50 to 300 Hz, sinusoidal waveform.
- d) Sudden changes of attenuation: with external control of timing (e.g. 0.1; 0.25; 1; 100 Hz) adjustable continuously or in steps up to total attenuation.
- e) Interruptions: with fixed duration of 1 ms and repetition period of 1s and/or with single interruptions with variable duration.

3.3 *Noise sources* (this subject needs further study)

- a) White noise.
- b) Impulsive noise: with adjustable level and adjustable pulse duration between 100 μ s and 1 ms and with repetition period of 1 second.
- c) Statistically distributed noise by recording or by simulation which is information to assist in standardizing a "Random noise simulator" which would encourage the utilization of block error counts.
- d) Single tone interference: with adjustable level of an additional signal frequency, variable between 300 and 3100 Hz.
- e) Harmonic distortion:
 - i) using a calibrating signal frequency of 700 Hz with the same r.m.s. level as the data signal and with its adjustable harmonic levels: a_{H2} , a_{H3} and a_{H4} , and
 - ii) using a calibrating signal frequency of 700 Hz with the same peak-to-peak level as the data signal and with its adjustable harmonic levels: a_{H2} , a_{H3} , and a_{H4} .

3.4 *Listener echo*

Listener echo: with the variable echo attenuation between 0 and 20 dB and variable echo time delay τ_E between 0 and 20 ms (worst case relevant).

4 **Measuring procedure**

4.1 *Measurement of the bit error rate (p_S) as a function of the signal-to-noise ratio (S/N) in the case of white noise*

The receiving level at the summation point should be -30 dBm for switched line comparisons and -20 dBm for leased line comparisons.

For a comparison, the value of S/N ratio at defined p_S values can be ascertained (e.g. $3 \cdot 10^{-4}$ or 10^{-5}).

4.2 *Measurement of the number of the bit error per second (F/t) as a function of the different faults and noise parameters (X)*

The receiving level at the summation point should be -30 dBm for switched line comparisons and -20 dBm for leased line comparisons.

For a comparison, the value of F/t for different defined fault and noise parameters, or the value of the

different parameters at the limit of the error-free region, can be ascertained.

FIGURE 2/V.56
Example of bit error rate as a function of the signal-to-noise ratio

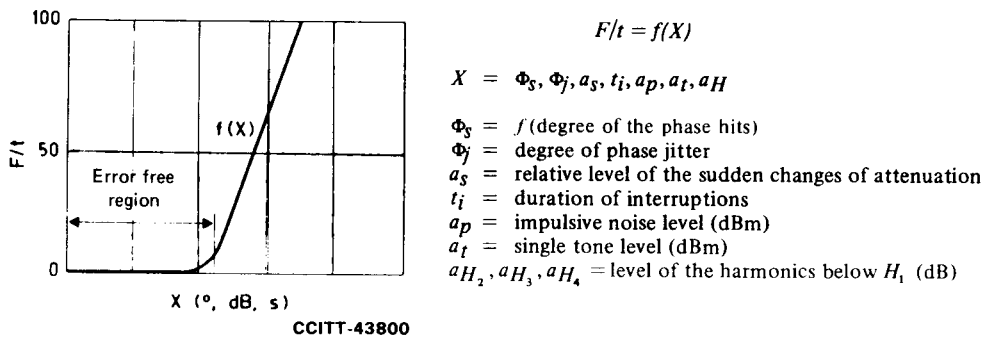

FIGURE 3/V.56
Example of bit error per second as a function of the value of different fault and noise parameters

TABLE 8/V.56

Eighteen selected tests according to §§ 1, 2, 3 and 4

Test	Test parameter according to Table 1/V.56	Test parameters according to §	Measuring procedure according to §
A	11	3.3a)	4.1
B	2, 3, 11	3.1.1 mode 1, 3.3a)	4.1
C	2, 3, 11	3.1.1 mode 2, 3.3a)	4.1
D	2, 3, 11	3.1.2 mode 1, 3.3a)	4.1
E	2, 3, 11	3.1.2 mode 2, 3.3a)	4.1
F	2, 3, 4, 11	3.1.1 mode 1, 3.2b) (± 6 Hz), 3.3.a)	4.1
