FOREWORD

The ITU-T (Telecommunication Standardization Sector) is a permanent organ of the International Telecommunication Union (ITU). The ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Conference (WTSC), which meets every four years, establishes the topics for study by the ITU-T Study Groups which, in their turn, produce Recommendations on these topics.

The approval of Recommendations by the Members of the ITU-T is covered by the procedure laid down in WTSC Resolution No. 1 (Helsinki, March 1-12, 1993).

ITU-T Recommendation X.1 was revised by ITU-T Study Group 7 (1993-1996) and was approved under the WTSC Resolution No. 1 procedure on the 5th of October 1996.

NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

4 Access to a packet-switched data transmission service	7
5 Access to a frame relay data transmission service	13

SUMMARY

The new version of this Recommendation has a significantly extended list of user classes of service. Frame relay service is included. Access from FRPDN and B-ISDN are reflected. Concept of port and direct access is involved. The text of this Recommendation is aligned with other X-Series Recommendations, new and revised.

Recommendation X.1

INTERNATIONAL USER CLASSES OF SERVICE IN, AND CATEGORIES OF ACCESS TO, PUBLIC DATA NETWORKS AND INTEGRATED SERVICES DIGITAL NETWORKS (ISDNs)

(Geneva, 1972; amended at Geneva, 1976 and 1980; Malaga-Torremolinos, 1984; Melbourne, 1988; Helsinki, 1993; revised in 1996)

1 Introduction

The establishment in various countries of public networks for data transmission and ISDNs for integrated services creates a need to standardize user classes of service and categories of access. This Recommendation is required to meet the following goals:

- a) providing sufficient data signalling rates to meet users' needs;
- b) allowing optimization of Data Terminal Equipment (DTE) and transmission and switching costs to provide an overall economic service to the user;
- c) recognizing particular operating modes of users' DTE;
- d) allowing users to transfer information consisting of any bit sequence and of any number of bits up to a certain amount;
- e) recognizing the interaction between users' requirements, technical limitations and tariff structure that may influence how DTE gains access to public data transmission services.

User class of service is a category of data transmission service in which the DTE operation mode, data signalling rate, call control signalling rates and code structure (in start-stop mode) are standardized.

Category of access identifies the method by which DTE gains access to a specific data transmission service.

There are four public data transmission services, namely:

- 1) leased circuit data transmission service;
- 2) circuit-switched data transmission service;
- 3) packet-switched data transmission service; and
- 4) frame relay data transmission service.

Access for Data Terminal Equipment (DTE) to data transmission services may be any of the following:

- a) *direct access* when DTE is connected to the network providing the service without intermediate switched network; or
- b) *port access* when DTE is connected to the network providing the service via intermediate switched network (see Figure 1).

Port access may be achieved by any of the following:

- 1) by *switched connection* when signalling/control procedures are required to establish/release connection of the DTE to the network providing the service; or
- 2) by *permanent connection* when no signalling/control procedures are required to establish/release the connection of the DTE to the network providing the service (see Figure 2).

The categories of access described in this Recommendation take into account direct access (see Note) to public data networks and ISDNs and the port access cases where interworking with other public networks is involved. Access to the packet-switched data transmission service via the PAD, FPAD or MAP function, as defined in Recommendations X.3, X.5 or X.8, respectively, is also covered in this Recommendation.

NOTE – Direct access may be provided by means of leased circuits or by dedicated access circuits.

a) Direct access

b) Port access

T0726140-96/d01

FIGURE 1/X.1
Examples of direct access and port access

a) Access with switched connection

b) Access with permanent connection

T0726150-96/d02

FIGURE 2/X.1
Two types of port access

For example, packet mode terminals may have access to the public packet-switched data transmission service, in user classes of service 8 to 11, either via a direct access (see above Note) or via a port access. The port access can be established using a Circuit-Switched Public Data Network (CSPDN), a Public Switched Telephone Network (PSTN), an ISDN or a PDN providing frame relay data transmission service. In all of these cases, an interworking function will be required to access the packet-switched data transmission service and both permanent and switched connections may be used for the access.

It is not mandatory for Administrations to provide all of the data transmission services, user classes of service, or categories of access contained in this Recommendation. In addition, categories of access have not been recognized for every user class of service; absence is indicated by an “ – ” in the tables below.

2 Access to a leased circuit data transmission service

See Tables 2-1 and 2-2.

TABLE 2-1/X.1
Access by data terminal equipment operating in synchronous mode
using X.21 or X.21 *bis* interfaces

User class of service	Data signalling rate in the data transfer phase (Note)	Categories of access
		Direct access
3	600 bit/s	F1
4	2400 bit/s	F2
5	4800 bit/s	F3
6	9600 bit/s	F4
7	48 kbit/s	F5
19	64 kbit/s	F6
31	128 kbit/s	F7
32	192 kbit/s	F8
33	256 kbit/s	F9
35	384 kbit/s	F10
37	512 kbit/s	F11
45	1024 kbit/s	F12
53	1536 kbit/s	F13
59	1920 kbit/s	F14

NOTE – The support of these user classes of service in the ISDN may be provided by means of a terminal adaptor (in accordance with Recommendation X.30). The concept of terminal adaptor functional grouping is defined in Recommendation I.411.

TABLE 2-2/X.1

**Access by data terminal equipment operating in start-stop mode
using X.20 or X.20 bis interfaces**

User class of service	Data signalling rate and code structure in data transfer phase	Categories of access
		Direct access
1	300 bit/s, 11 ^{a)} units/character start-stop	E2
2	50 to 200 bit/s, 7.5 to 11 ^{a)} units/character start-stop	E1
14	600 bit/s, 10 units/character start-stop	E3
15	1200 bit/s, 10 units/character start-stop	E4
16	2400 bit/s, 10 units/character start-stop	E5
17	4800 bit/s, 10 units/character start-stop	E6
18	9600 bit/s, 10 units/character start-stop	E7

^{a)} Usage in accordance with Recommendation X.4.

NOTE – Some Administrations are offering leased circuits asynchronous services for terminals operating at the data signalling rate of 600 bit/s, 1200 bit/s, 2400 bit/s, 4800 bit/s and 9600 bit/s supporting them by the synchronous network bearer channels with asynchronous to synchronous coding. The asynchronous to synchronous coding is described in Recommendation V.14 for the data signalling rates of 600 bit/s, 4800 bit/s, 9600 bit/s and Recommendation X.52 for 1200 bit/s.

3 Access to a circuit-switched data transmission service

See Tables 3-1 and 3-2.

TABLE 3-1/X.1
**Access by data terminal equipment operating in start-stop mode
 using X.20 or X.20 bis interfaces**
 (Note 1)

User class of service	Data signalling rate and code structure in data transfer phase (Note 2)	Call control signals in the call control phase	Categories of access
			Direct access
1	300 bit/s, 11 ^{a)} units/character start-stop	300 bit/s, International Alphabet No. 5 (11 units/character) start-stop	A2
2	50 to 200 bit/s, 7.5 to 11 ^{a)} units/character start-stop (Notes 3 and 4)	200 bit/s, International Alphabet No. 5 (11 units/character) start-stop (Note 5)	A1
14	600 bit/s, 10 units/character start-stop	600 bit/s, International Alphabet No. 5 (10 units/character) start-stop	A3
15	1200 bit/s, 10 units/character start-stop	1200 bit/s, International Alphabet No. 5 (10 units/character) start-stop	A4
16	2400 bit/s, 10 units/character start-stop	2400 bit/s, International Alphabet No. 5 (10 units/character) start-stop	A5
17	4800 bit/s, 10 units/character start-stop	4800 bit/s, International Alphabet No. 5 (10 units/character) start-stop	A6
18	9600 bit/s, 10 units/character start-stop	9600 bit/s, International Alphabet No. 5 (10 units/character) start-stop	A7

^{a)} Usage in accordance with Recommendation X.4.

NOTES

1 There is no user class of service for data signalling rate of 50 bit/s, the transmission mode of 7.5 units/character start-stop and address selection and call progress signals at 50 bit/s, International Telegraph Alphabet No. 2. However, several Administrations have indicated that their telex service (50-baud, International Telegraph Alphabet No. 2) will be provided as one of the many services carried by their public data network.

2 User classes of service 1, 2 and 15 are supported by the synchronous network bearer channels with asynchronous to synchronous coding according to Recommendation X.52. For user classes of service 14, 16, 17 and 18, the asynchronous to synchronous coding of Recommendation V.14 is used.

3 User class of service 2 will provide, in the data transfer phase, for operation at the following data signalling rates and code structures:

- 50 bit/s (7.5 units/character)
- 100 bit/s (7.5 units/character)
- 110 bit/s (11 units/character)
- 134.5 bit/s (9 units/character)
- 200 bit/s (11 units/character)

Call control signals would be at 200 bit/s, International Alphabet No. 5 (11 units/character).

4 For international user class of service 2, it should be noted that some public data networks may not be able to prevent two terminals working at different data signalling rates and code structures from being connected together by means of a circuit-switched connection.

5 Some Administrations have indicated that, for certain data signalling rates listed in Note 3 above, they will permit users in class of service 2 to operate the same signalling rate and code structure for both data transfer and address selection and to receive call progress signals at these signalling rates and code structures. Where International Alphabet No. 5 is used for the call control signals, the appropriate parts of Recommendation X.20 shall apply.

TABLE 3-2/X.1

**Access by data terminal equipment operating in synchronous mode
using X.21 or X.21 bis interfaces**

User class of service	Data signalling rate in the data transfer phase (Note 1)	Call control signals in the call control phase (Notes 2 and 3)	Categories of access		
			Direct access	Port access via ISDN (Notes 4 and 5) with:	
				Permanent connection	Switched connection
3	600 bit/s	600 bit/s, International Alphabet No. 5	B1	S1	R1
4	2400 bit/s	2400 bit/s, International Alphabet No. 5	B2	S2	R2
5	4800 bit/s	4800 bit/s, International Alphabet No. 5	B3	S3	R3
6	9600 bit/s	9600 bit/s, International Alphabet No. 5	B4	S4	R4

30	64 kbit/s	64 kbit/s, International Alphabet No. 5	B6	S6	R6
35	384 kbit/s	384 kbit/s, International Alphabet No. 5	B7	S7	R7
53	1536 kbit/s	1536 kbit/s, International Alphabet No. 5	B8	S8	R8
59	1920 kbit/s	1920 kbit/s, International Alphabet No. 5	B9	S9	R9

NOTES

1 Some Administrations are offering circuit-switched asynchronous services for terminals operating at the data signalling rate of 600 bit/s, 1200 bit/s, 2400 bit/s, 4800 bit/s, 9600 bit/s with 10 units/character, start-stop in the data transfer phase and, respectively, 600 bit/s, 1200 bit/s, 2400 bit/s, 4800 bit/s, 9600 bit/s, International Alphabet No. 5, 10 units/character, start-stop in the call control phase. These services are supported by the synchronous network bearer channels with asynchronous to synchronous coding according to Recommendation X.52 for user classes of service 1 and 2 and for 1200 bit/s. For the data signalling rates of 600 bit/s, 2400 bit/s, 4800 bit/s, and 9600 bit/s, the asynchronous to synchronous coding of Recommendation V.14 is used.

2 Only applicable when using the X.21 interface.

3 The characteristics at the reference point R for user classes of service 30 and higher are for further study.

4 The support of these user classes of service in the ISDN may be provided by means of a terminal adaptor (in accordance with Recommendation X.30). The concept of terminal adaptor functional grouping is defined in Recommendation I.411.

5 The call control signals used for categories of access S6 through S9 and R6 through R9 will be in accordance with those defined for ISDN at reference point S/T. For interface at reference point R, see the corresponding user class of service for the same data signalling rate in this table. Reference points R, S, and T are defined in Recommendation I.411.

4 Access to a packet-switched data transmission service

See Tables 4-1 to 4-5.

NOTES to Tables 4-1, 4-2 and 4-3

- 1 The packet switched data transmission service allows for communication between data terminal equipments operating at different data signalling rates.
- 2 The support of these user classes of service in the ISDN may be provided by means of a terminal adaptor (in accordance with Recommendation X.31). The concept of terminal adaptor functional grouping is defined in Recommendation I.411.
- 3 Recommendation X.31 (case A) is appropriate:
 - at the S/T reference point when categories of access D5 and Q5 are provided via an ISDN B-channel;
 - at the S/T reference point when categories of access D9, D12, D13, Q6, Q7 and Q8 are provided via an ISDN H-channel; or
 - at the R reference point when categories of access D1, D2, D3, D4, D5, Q1, Q2, Q3, Q4 and Q5 are provided via an ISDN B-channel with terminal adaptors.
- 4 Recommendations X.31 (case A) and X.32 are appropriate at the S/T reference point. Recommendation X.32 is appropriate at the R reference point.
- 5 The characteristics at the reference point R for user classes of service 30 and higher are for further study.
- 6 Recommendation X.36 is used.
- 7 Recommendation X.34 is used.

TABLE 4-4/X.1

Access by data terminal equipment operating in start-stop mode using X.28 interface
(Notes 1 and 2)

User class of service	Data signalling rate and code structure (Note 3)	Categories of access				
		Direct access (Note 4)	Service provided by a PSPDN with:			
			Port access with:			
			Switched connection		Permanent connection	
			via CSPDN	via PSTN	via CSPDN	via PSTN
20 (Note 5)	50-300 bit/s, 10 or 11 units/character	C1, C2, C3	K1	L1, L2, L3	I1	J1, J2, J3
21	75/1200 bit/s, 10 units/character (Note 6)	C5	–	L5	–	J5
22	1200 bit/s, 10 units/character	C4	K4	L4	I4	J4
23	2400 bit/s, 10 units/character	C6	K6	L6	I6	J6
24	4800 bit/s, 10 units/character	C7	K7	L7	I7	J7
25	9600 bit/s, 10 units/character	C8	K8	L8	I8	J8
26	14 400 bit/s, 10 units/character	C9	–	L9	–	J9

NOTES

- 1 The packet-switched data transmission service allows for communication between X.25 and/or X.28 data terminal equipments operating at different data signalling rates.
- 2 The support of X.28 DTE in the ISDN is for further study.
- 3 Some Administrations are offering circuit-switched asynchronous services for terminals operating at the data signalling rate of 600 bit/s, 10 units/character, start-stop in the data transfer phase and 600 bit/s, International Alphabet No. 5, 10 units/character, start-stop in the call control phase. For the data signalling rate 600 bit/s, the asynchronous to synchronous coding of Recommendation V.14 is used.
- 4 Some Administrations may offer the categories of access of 600 bit/s.
- 5 User class of service 20 allows for categories of access according to the following speeds:
 - by direct access: C1 at 110 bit/s, C2 at 200 bit/s and C3 at 300 bit/s;
 - by port access via a CSPDN: K1 and I1 at 300 bit/s;
 - by port access via PSTN: L1 and J1 at 110 bit/s, L2 and J2 at 200 bit/s and L3 and J3 at 300 bit/s.
- 6 75 bit/s from DTE to DCE, 1200 bit/s from DCE to DTE.

TABLE 4-5/X.1

Access by Group 3 facsimile terminals using X.38 interface

(Note 1)

User class of service	Data signalling rate	Categories of access		
		Service provided by a PSPDN with:		
		Direct access	Port access with:	
			Switched connection	Permanent connection
		via PSTN	via PSTN	
29	300/2400/2400-14 400 bit/s (Note 2)	FAXC	FAXA	FAXB

NOTES

- 1 The packet-switched data transmission service allows for communication between X.25 and/or X.38 data terminal equipments operating at different data signalling rates. The support of X.38 terminals in the ISDN is for further study.
- 2 Operation of the facsimile terminal equipment is in accordance with Recommendation T.4 for image data encoding at speeds of 2400-14 400 bit/s and in accordance with Recommendation T.30 for control signalling at speeds of 300 bit/s or, optionally, 2400 bit/s.

5 Access to a frame relay data transmission service

See Table 5-1.

NOTES

- 1 The interface for ISDN is defined in Recommendations I.430, I.431, Q.921, Q.922 and Q.933. The interface for FRPDN is defined in Recommendation X.36.
- 2 DTE using X.25 interface may operate by means of a terminal adaptor.
- 3 Services provided by an ISDN Frame Relaying Bearer Service (FRBS) are the responsibility of Study Group 13.
