123

124 2. Overview and Scope

125 2.1. Objectives

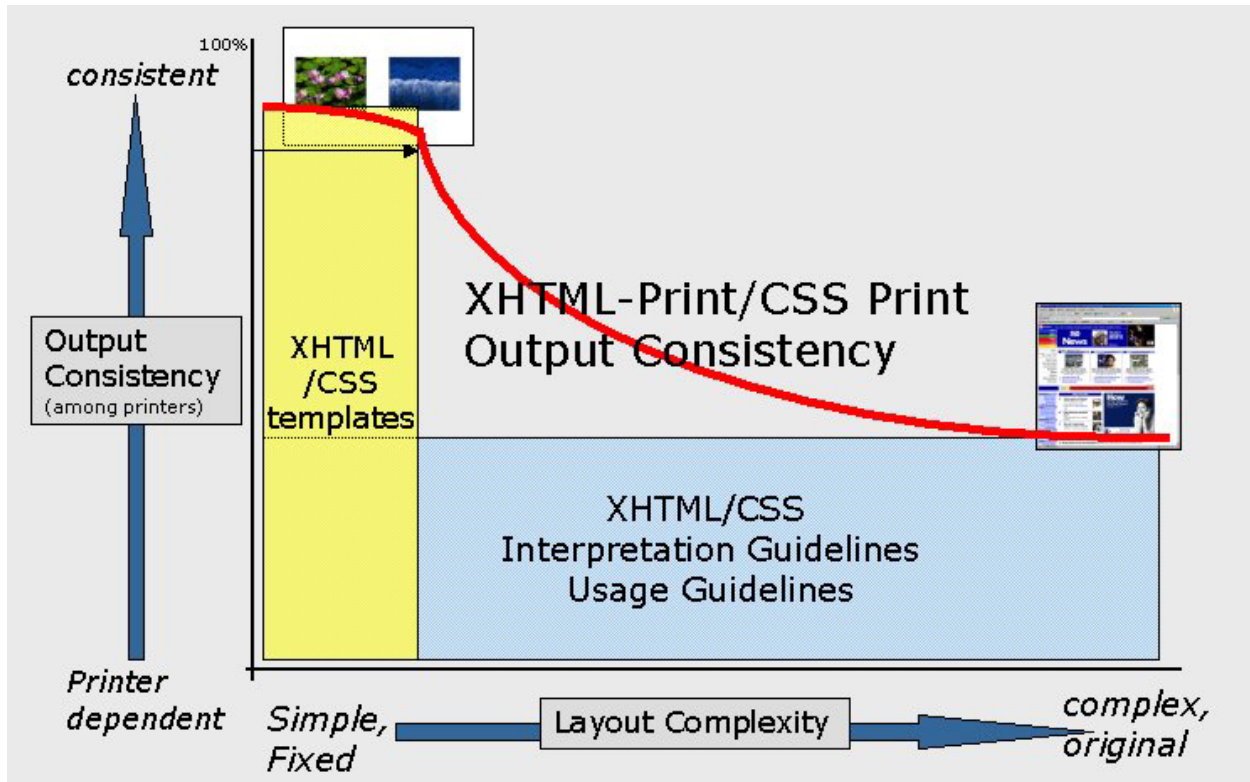

126 This document provides guidelines for PrintEnhanced:1 Print Service developers and Control Points and other
127 content authors with the following objectives :

- 128 ● Enable an improved level of output consistency on print media among printing devices which support
129 XHTML-Print and CSS Print Profile .
- 130 ● Suggest methods for content authors to avoid ambiguities within the current W3C specifications referenced by
131 the PrintEnhanced:1 service.
- 132 ● Provide guidance to Print Service developers in areas of ambiguity.
- 133 ● Provide leveragable samples for content authors to build from.

134 2.2. Organization

135 To achieve the above objectives, the document is organized into the following sections:

- 136 ● *Clarification and Interpretation Guidelines for XHTML-Print [XHTML-PRINT] /CSS Print Profile*
137 *[CSSPP]Content parsing and Layout:*
 - 138 ● Guidelines on how PrintEnhanced:1 compliant printers should interpret XHTML-Print [XHTML-PRINT]
139 and CSS Print Profile [CSSPP] expressions that are ambiguous and may lead to varying outputs
- 140 ● *XHTML-Print /CSS-Print Usage Guidelines*
 - 141 ● Guidelines on how XHTML-Print[XHTML-PRINT] and CSS Print Profile [CSSPP] contents intended for
142 output from PrintEnhanced:1 compliant printers should be created in order to achieve output consistency
143 among various printers.
- 144 ● *Sample Template XHTML-Print [XHTML-PRINT] /CSS Print Profile [CSSPP] source and corresponding*
145 *expected output for several simple photo layout contents.*

146
147
148
149
150
151
152
153
154
155
156

Output of XHTML and CSS to paged media, such as printed-paper is different from display on screen media in that pagination is considered. This, with the fact that some ambiguity exists in the interpretation of XHTML and CSS is thought to lead to various inconsistent outputs among output devices (i.e. printers), which is unexpected. The interpretation guidelines and usage guidelines in this document will assure a certain level of output consistency among printers, regardless of layout complexity of the content. In addition, use of sample templates for simple photo layouts will serve as reference to both printer implementations and content authors to achieve a high level of consistency.

157 **2.3. Conventions**

158 **2.3.1. Assumptions for Source Examples**

159 All examples assume default values as recommended for the Printer’s default style sheet in Section 8.5 of [CSSPP]
160 unless otherwise stated.

161

162 3. Guidelines

163 3.1. References

180

181 3.2. Interpretation Guidelines and Clarifications

182 This section provides guidelines and clarifications for PrintEnhanced:1 compliant printer implementations,
183 especially where the W3C reference specifications are ambiguous or allow varying interpretations that can lead to
184 visibly different output

185 It is strongly recommended that printers follow the informative guidelines provided in Section 8.5 of [CSSPP] in
186 establishing default style sheet values.

187 In addition, PrintEnhanced:1 printer implementations should comply with the following guidelines in order to
188 achieve greater output consistency.

189 3.2.1. Establishing the Default Page Box

190 When an @page ‘size’ attribute is specified, the content area of the infinitely sized canvas is constrained as
191 indicated by the page size. When the @page ‘size’ attribute is not specified, it is recommended that the canvas size
192 is constrained as though

193 `@page { size: auto; }`

194 were specified.

195 This establishes a default page box the same size as the target page sheet. The resulting page area is the initial
196 containing block. The page area is the page box minus the page margins.

197 **3.2.2. Mapping the Page Box to the Page Sheet**

198 The current CSS specifications do not specify how the page box is mapped to the target page sheet. This document
199 recommends the following guidelines:

200 **3.2.2.1. Page Size: auto**

201 When the size of the page box is established with the value 'auto', the page box should exactly overlay the target
202 page sheet; *i.e.*, the edges of the page box and the edges of the target sheet are aligned.

203 **3.2.2.2. Origin**

204 If there is no ancestor with a 'position' of 'absolute', 'relative' or 'fixed', the origin with respect to the positioning of
205 elements is the upper-left corner of the page box.

206 While this is unambiguous for single-page documents, CSS is ambiguous when the document contains more than
207 one page. See Section 3.2.5 for further details.

208 **3.2.2.3. Mapping a Page Box to a Larger Page Sheet**

209 When the size of the page box is smaller than the size of the physical page sheet, the printer may (in order of
210 preference):

- 211 1. Prompt the user to provide media the size of the page box.
- 212 2. Center the page box on the page sheet without scaling.
- 213 3. Position the top and left edges of the page box at the top and left edges of the page sheet.
- 214 4. Uniformly scale the page box up as much as possible to fit the page sheet while preserving the
215 aspect ratio of the page box.
- 216 5. Non-uniformly scale the page box to take up the entire page sheet.

217

218 **3.2.2.4. Mapping a Page Box to a Smaller Page Sheet**

219 When the size of the page box is larger than the size of the physical page sheet, the printer may (in order of
220 preference):

- 221 1. Prompt the user to provide media the same size as the page box.
- 222 2. Scale the page box down to fit the page sheet.
- 223 3. Crop the portions of the page box which do not fit on the page sheet, centering the page box with
224 respect to the page sheet.

225 Crop the portions of the page box which do not fit on the page sheet, aligning the top and left edges of the page box
226 and the page sheet.

227 **3.2.3. Padding and Borders**

228 As defined in CSS, padding and border widths are NOT included in the content width /height.

229

230 **Source**

```

231
232 <html xmlns="http://www.w3.org/1999/xhtml">
233 <head>
234 <title>New XHTML file Padding and Borders</title>
235 <style type="text/css">
236 @media print {
237   @page { size:A4 portrait;}
238 }
239 </style>
240 </head>
241 <body>
242 <p style="width:80mm; height:50mm;
243 border-style: solid; border-width:1.0mm; padding:4.0mm 0mm; text-align:
244 center;">
245 --Text A--
246 </p> </body>
247 </html>
248

```

249 **Note**

250 The content, padding and borders are represented according to the figure below.

260 **Expected Layout**

275 **3.2.4. Units of Measure**

276 Printers implement a wide range of resolutions and pixel depth. To improve consistency of printed output, and for
 277 compliance with the recommendation in Section 4.3.2 of [CSS2_1], it is recommended that Printers implement the
 278 pixel unit of measure as approximately 1/96 inch, or 0.26 mm, unless dimensions are otherwise specified.

279 3.2.5. Absolute Positioning and the Origin

280 From Cascading Style Sheets Level 2 Revision 1 [CSS2_1], Section 10.1: 'In paged media, an absolutely positioned
281 element is positioned relative to its containing block ignoring any page breaks (as if the document were continuous).
282 The element may subsequently be broken over several pages.'

283 Therefore, in the absence of an ancestor with a 'position' of 'absolute', 'relative' or 'fixed', the origin for any
284 absolutely positioned content within a document would seem to be the origin of the first page of the document.

285 However, Section 13.2 of [CSS 2_1] says “the edges of the page area act as the initial containing block...” One
286 might expect that pages subsequent to the first page of a document would establish new “initial containing blocks”.
287 Indeed, what other reasonable interpretation can be made? Since absolute positioning is done relative to the
288 containing block, this would seem to imply the origin should reset to the top of the next page upon a page break.

289 The W3C CSS WG needs to resolve or clarify this ambiguity. Until such time, this Guideline makes no
290 recommendation as to which interpretation a printer should make. Rather, Section 3.3.3 strongly cautions content
291 authors to avoid these ambiguous scenarios.

292 3.2.6. Page Break

293 This section describes the recommended behaviors of PrintEnhanced:1 printers for page break control

294 3.2.6.1. Condition on Implicit Page Break in the Normal Flow

295 The printer should not break the current page until content is seen which is placed on the subsequent page.

296 3.2.6.2. 2. Suppressing the First and/or Last Blank Page that Occurred by Forced Page Break

297 If a document uses a common forced page break style on all pages including the first and/or last pages (to make the
298 document source simple), user agents may suppress the first and/or last blank page that occurs by the forced page
299 break.

300 3.2.7. Contents Outside the Page Box

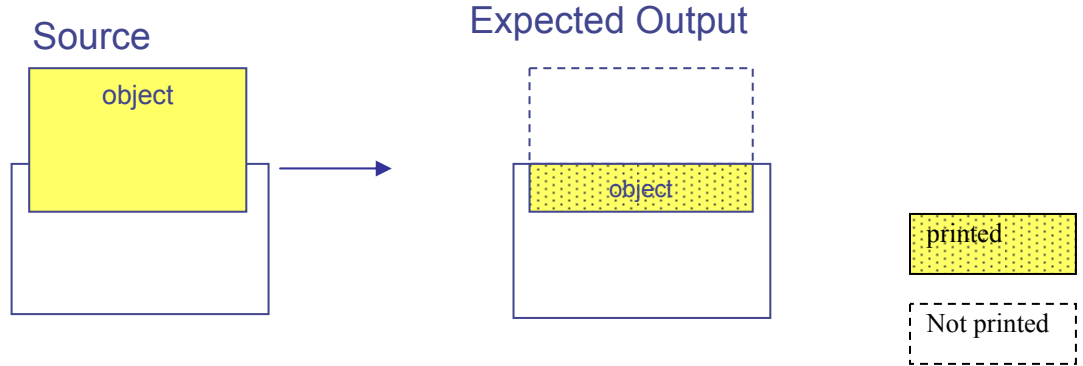

301

- 302 ● Contents, or portions of contents that overflow horizontally out of the page box should not be printed.

- 303 ● Contents, or portions of contents that overflow above (vertically negative out of) the page box should not be
304 printed.
305

306

307

308 **3.2.8. Images**

309 **3.2.8.1. Image Rendering Resolution**

310 When size information is not provided for an image (*i.e.*, neither height nor width is specified, or they are both set to
 311 'auto'), it is recommended that the image is printed at about 96 dpi, or about 5 dots per mm. (This is consistent with
 312 the resolution used for computer displays, and will promote consistency in output across displays and printers.)

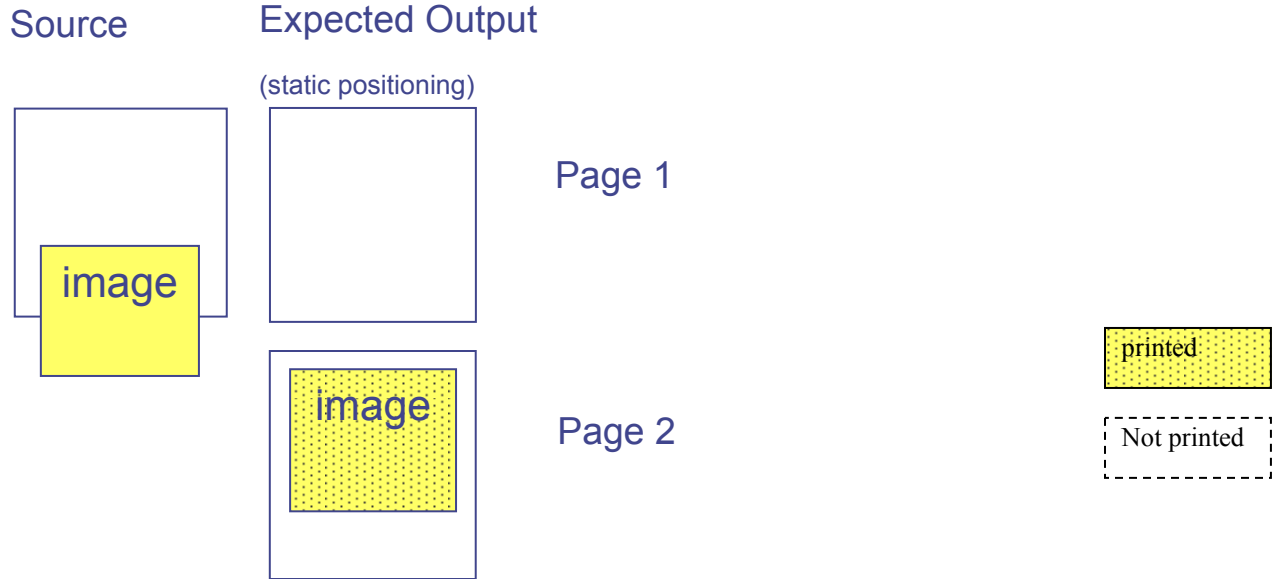

313 **3.2.8.2. Image Rotation**

314 Use of the JFIF APP0 marker and the EXIF APP1/APP2 markers to determine image orientation are deprecated;
 315 any rotation information in such markers should be ignored. The CSS3 Paged Media Module [CSS3_PM] image-
 316 orientation property should be used instead.

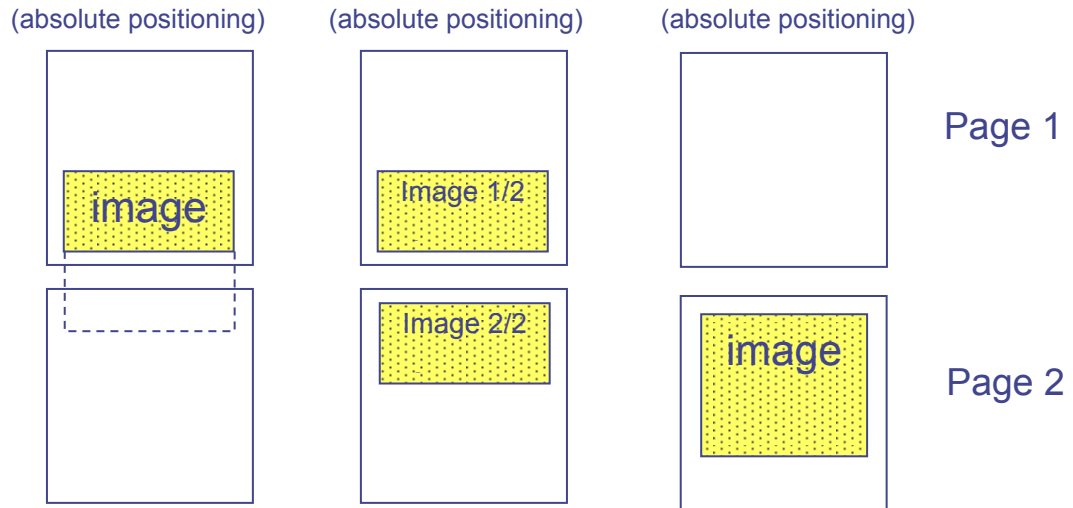

317 **3.2.8.3. Image Across Pages**

318 When an image extends beyond the bottom of a page, and it is not positioned (that is, it is statically positioned in the
 319 normal flow), the image should NOT be divided, but should be placed on the next page. When the image is
 320 positioned (that is, its position property is absolute, fixed, or relative), three possible outputs are allowed due to
 321 ambiguity in [CSS 2_1].

322

Possible Output 1 Possible Output 2 Possible Output 3

323

324 **3.2.8.4. Images in Table Cells**

325 When an image is laid out inside a table cell, the following guidelines apply:

- 326 1. If an 'image-orientation' is specified, the image is first rotated accordingly. After rotation, the 'width' property corresponds to the size of a row of pixels, while the 'height' property corresponds to the size of a column of pixels.
- 327 2. If both 'width' and 'height' properties specify a length, the image is scaled to the indicated height and width and centered within the table cell. If portions of the image extend beyond the content area of the table cell, the 'overflow' property determines whether those portions are displayed or cropped.
- 328 3. If either the 'width' or the 'height' property specifies a length (but not both; the other property is absent or 'auto'), the indicated aspect of the image is scaled to the specified dimension, and the other aspect of the image is scaled so that the intrinsic aspect ratio of the source image is preserved.
- 329 4. If neither the 'width' nor the 'height' property specifies a length, the intrinsic size and aspect ratio of the source image should be preserved. If the intrinsic size is not known, and in the absence of any other

337 'clues' as to the intended output size, it is recommended that the image is rendered at approximately 96
338 pixels per inch or 0.26 mm.

339 **3.2.9. Layer Control**

340 This section describes the recommended behaviors of PrintEnhanced:1 printers for layer control.

341 ***3.2.9.1. Static Positioning***

342 In the normal flow, the block boxes can be positioned to overlap by specifying the "margin-top, margin-left margin-
343 bottom, margin-right" property. When block boxes visually overlap, those appearing later in the source should be
344 painted nearer to the user and, those appearing earlier in the source should be painted further from the user.

345

346 ***3.2.9.2. Absolute Positioning***

347 The block boxes can be positioned to overlap by specifying the "top, left, bottom, right" property. When block-
348 boxes visually overlap, those appearing later in the source should be painted nearer to the user and, those appearing
349 earlier in the source should be painted further from the user.

350

351 **3.2.10. Text Across Pages**

352 A text box laid out according to the normal flow which extends beyond the bottom of the page box should be
353 divided between line boxes to fill the first page. Which line boxes of the paragraph are on the current page and
354 which are on the next page is determined by the widows and orphans properties. With absolute positioning, two
355 possible outputs are allowed due to ambiguity in [CSS 2_1].

356

357

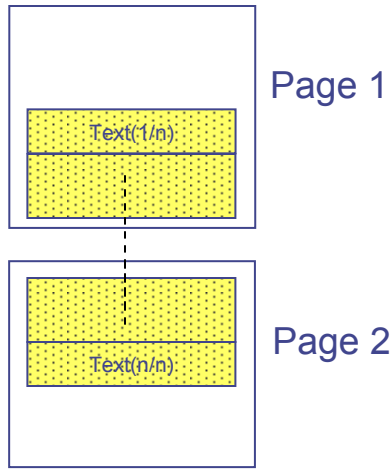

358

Source

Expected Output

(static positioning)

Possible Output 1

(absolute positioning)

Possible Output 2

(absolute positioning)

359
360

361 **3.2.11. Character Sets and Fonts**

362 **3.2.11.1. Character Repertoire**

363 PrintEnhanced:1 compliant printers should support Basic Latin (U+0000-U+007F) and Latin-1 Supplement
 364 (U+0080-U+00FF) characters of the set ISO/IEC 10646. When PrintEnhanced:1 printers encounter characters that
 365 are recognized but not renderable, they should substitute another rendering that gives the same meaning, or provide
 366 a way to indicate that normal rendering has not been successful.

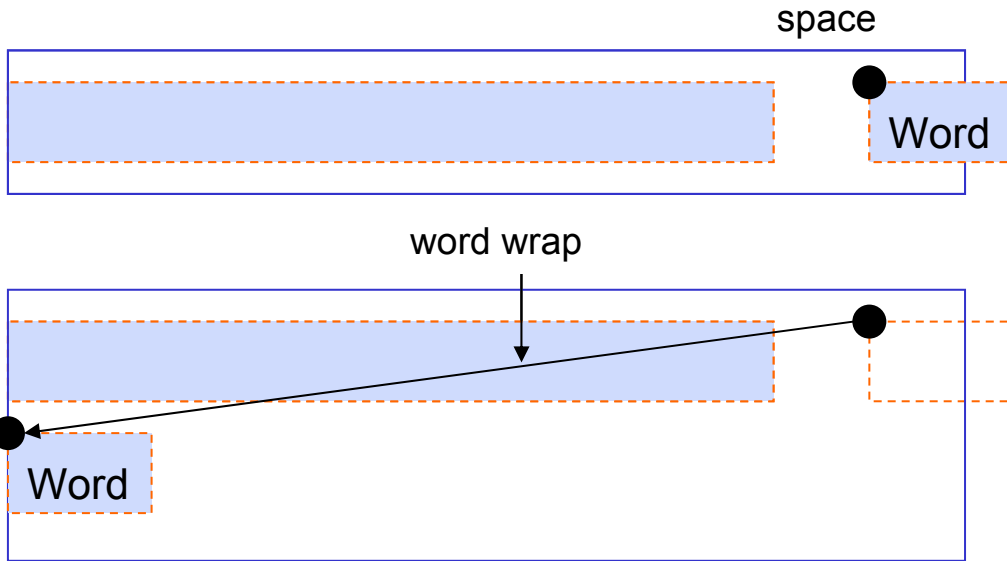

367 **3.2.11.2. Font Family**

368 If PrintEnhanced:1 printers support extended character repertoires, then "serif", "sans-serif" and "monospace" font
 369 families should also include the extended characters.

370 **3.2.12. Word Wrap and Line Breaks**

371 **3.2.12.1. Word Wrap**

- 372 ● Complete words that won't fit on the current line should be wrapped onto the next line.

373 See Section 9.4.2 of CSS 2.1 [CSS2_1] for exceptions and further details.

- 376 ● Shortened words, such as “what’s”, should be processed as one word.

378 **3.2.12.2. Line Break**

379 Spaces and hyphens should be treated as a line break opportunity, and line breaks should not occur within a word.

380 The following algorithm is provided as an example of one optional approach to determine line breaking.

- 382 ● Any of the following characters shown in the following tables, if appearing at the end of a word should not wrap to the next line.
- 384 ● Any of the following single characters shown in the following tables if immediately preceding an associated word should not be split from that word for word wrap purposes. The character should be wrapped along with the word.
- 387 ● Handling of repetitive use of the characters shown in the following tables will be implementation dependent, and out of scope of this guideline.

389 **Characters that Should NOT be Placed on Top of the Line**

402

403 **3.2.12.3. Other Suggested References**

404 The *Unicode Standard Annex #14 Line Breaking Properties* [LINE-BREAK] provides a comprehensive treatment
 405 of line breaking recommendations, for best practice and further references. However, it is to be expected that many
 406 PrintEnhanced:1 printers will not implement line break algorithms requiring linguistic analysis or large pair-based
 407 tables.

408

409 **3.2.13. Forms**

410 PrintEnhanced:1 compliant printers should comply with the following guidelines in interpreting and rendering the
 411 following form elements.

412 **3.2.13.1. Text Area Element**

- 413 ● Scrollbars may or may not be printed for text area elements.
- 414 ● A slider should be printed if the text area contents overflow the input field and overflow='hidden'.
- 415 ● The text area may be enlarged to encompass overflow contents when overflow='visible'.
- 416 ● A slider should NOT be printed if the contents of the text area do not overflow from the input field.
- 417 ● A slider should NOT be printed if there are no contents in the text area
- 418 ● The design and layout of the scroll bar is implementation dependent.

419

An example of a text area output where the text does not overflow from the textarea.

An example of a text area output where the text overflows from the textarea.

a portion of it will not be printed.

An example of a text area output where there is no text in the textarea.

420
421

422 3.2.13.2. *Select Element*

- 423 ● A Down-Arrow may or may not be printed if the size attribute is unset or set as 1.
- 424 ● A Scroll bar may or may not be printed if the size attribute set as greater than 1.
- 425 ● A Slider should be printed if the number of option elements is greater than the value of set attribute.
- 426 ● The design and layout of the scroll bar is implementation dependent.
- 427 ● The first selected element should be printed.
- 428

Source

Expected Output

Size attribute not set

```
<select>
<option>Object1</option>
</select>
```

Size attribute set to 1

```
<select size="1">
<option>Object1</option>
</select>
```

Size attribute set to greater than 1

```
<select size="2">
<option>Object1</option>
<option>Object2</option>
</select>
```

Number of option elements are greater than size attribute value

```
<select size="2">
<option>Object1</option>
<option>Object2</option>
<option>Object3</option>
</select>
```

429

430 **3.2.13.3. Input Element**

431 Input fields with a type attribute of “password” should be filled with “*” (asterisks) if the value attribute is present.

432 The number of asterisks should equal the number of Unicode characters in the value, not the number of bytes.

433

434 3.3. Usage Guidelines

435 This section provides guidelines on how XHTML-Print [XHTML-PRINT] and CSS Print Profile [CSSP] contents
436 intended for output from PrintEnhanced:1 compliant printers should be created in order to achieve output
437 consistency among various printers. Though the guidelines do not have to be applied to contents with non-print
438 media as it's primary intended output, its strongly recommended to follow these guidelines in authoring contents
439 that prioritize output consistency on paged media.

440 3.3.1. Media Information

441 Contents intended for printing should specify media information in it's style sheet by the use of @media print{}

442 3.3.2. Paging

443 Paged media differ from screen media in that it introduces the concept of pagination. Contents intended for
444 PrintEnhanced:1 compliant printers should be conscious of page media by following the guidelines below. Though
445 contents that do not include page information, or are intended for screen media only can be printed, they may
446 exhibit less output consistency among printers.

447 3.3.2.1. @page Size

448 In order for the printer to recognize the intended page size of the content, @page size information should always be
449 included in the contents. The page size property is essential for printers to maintain the intended output design,
450 since the contents structures typically have strong relationships with media size.

451 3.3.2.2. Page Break Control

452 There are two models of use which should be carefully considered when constructing XHTML and CSS content
453 intended for printing: one where the Printer is primarily in control of the placement of page breaks, and the other
454 where the Content Author is primarily in control. Each has its merits and disadvantages.

455 3.3.2.2.1. *Implicit (Printer) Control*

456 When it is important that all the content be printed, but it is not important that the content is laid out in a certain
457 fashion, it is best to by and large use static positioning, and let the Printer decide how to lay out the contents and
458 where to put page breaks. This model is also preferable when the contents contain mixed fonts and various point
459 sizes of text that flows across pages. In this case it's better to let the printer do the page breaks, attending to widows
460 and orphans and putting the breaks between line boxes as required by CSS2.1. In this scheme, page-break-* would
461 be used sparsely for stylistic reasons, such as to ensure that major headings start at the top of the page, or page
462 breaks are avoided inside list item elements. Although the exact layout of the document will vary from printer to
463 printer, this approach will yield pleasing results from most all printers.

464 3.3.2.2.2. *Explicit Control*

465 When it is important that contents are laid out in a very specific and deterministic manner, page break information
466 should be explicitly provided for contents intended for inclusion in one page. The use of page-break-before, page-
467 break-after, page-break- inside, and named pages [CSS3_PM] is recommended to inform the printer of paging
468 information. Note that these properties only apply to block elements.

469 3.3.2.3. *Page Size Change within a Document.*

470 Changing the page size or orientation within a single html element is allowed. The example below intends to show
471 that a document can have more than one page-configuration and, alteration of the media-size within the document
472 results in page-break. This is achieved by defining different @page guidelines for each page size or orientation to be
473 used within the document source.

- 474 ● If a block box with inline content has a 'page' property that is different from the preceding block box with
475 inline content, then one or two page breaks are inserted between them, and the boxes after the break are
476 rendered on a page box of the named type.
- 477 ● @page rules apply to pages, not to elements, and so inheritance does not apply as pages do not have children.
- 478 ● @page rules *do* cascade however, as several different rules may match the same page, and their declarations
479 will need to be ordered by specificity / priority.
- 480 ● While a preceding block element has the @page value, “initial value” is applied to the subsequent element and
481 if they are different; then a page break should be generated.

482

483 Example 1: Page Size Change

484

485 Description

486 In this example, the generation of the fourth page deserves some additional explanation:

- 487 ● The <h2> element of class 'newpage-1' generates a new page (the second page), because of the
488 explicit 'page-break-before' in the newpage-1 selector:
489 “h2.newpage-1 {page-break-before: always;}”
- 490 ● The <h2> element of class 'newpage-2' generates another new page (the third page), because the page
491 property overrides the initial value of A4 portrait with a value of A4 landscape; the 'newpage-2'
492 contents are therefore placed on a landscape page:
493 “h2.newpage-2 {page: a4-landscape;}”
- 494 ● The page attribute for the final <h2> element cascades back to the page size and orientation that were
495 in effect before the <h2> of class 'newpage-2' (since the scope of that element has closed), *i.e.*, A4
496 portrait, causing another page break and generating the fourth page.

603 <h2 class="newpage-2">Section-3: Landscape Page</h2>
604 <p class="newpage-2">page three contents</p>
605 <p class="newpage-2">all non-nested elements should have a common @page
606 property</p>
607 <h2>Section-4: Portrait Page</h2>
608 <p>page four contents</p>
609 </body>
610 </html>

```

Expected Output

628 3.3.3. Pixels

629 3.3.3.1. Unit of Measure

630 Printers are expected but not required to implement the pixel unit of measure as approximately 1/96 inch or .26 mm.
631 Unless there are good reasons to use the pixel length, consideration should be given to use a measure guaranteed to
632 be consistent across user agents, such as the millimeter.

633 3.3.3.2. Image Resolution

634 It is strongly recommended that either height or width or both are specified for image size. (The XHTML-Print
635 specification allows printers to omit images when no size information is provided.) When no size information is
636 provided, or both height and width are set to 'auto', printers are expected but not required to render images at about
637 96 dpi or 5 dots per mm.

638 3.3.4. Positioning (absolute positioning / static positioning)

639 The following should be taken into consideration when creating XHTML-Print / CSS Print contents intended for
640 output from PrintEnhanced:1 compliant printers.

- 641
- 642 ● Absolute positioning should ONLY be used for contents that are sure to fit within the current page box. Avoid
643 the use of absolute positioning unless positioning is carefully considered to fit within the specified page size.
 - 644 ● Contents that may not fit in one page should be laid out by one of the following methods:
 - 645 ➤ Paginate by explicitly using page-breaks and named pages, in case of using absolute positioning.
 - 646 ➤ Use static positioning for layout.
 - 647 ● Contents creation that does not consider pagination should use static positioning.
 - 648 ● Objects should not be positioned either entirely or partly outside of the page box, unless cropping of the
649 overflowed content is intended. In this case, the overflow property should be set to 'hidden'.
 - 650 ● If content authors apply forced page-break style to every page, the style may generate either an empty start
651 page or an empty end page. To avoid this inconsistency, content authors should:
 - 652 ➤ Avoid making documents that begin with a FORCED page break
 - 653 ➤ Avoid making documents that end with a FORCED page break
- 654
- 655 ● The following CSS styling is recommended to establish a div which maps to the page area. Elements can then
656 be positioned relative to the div, which is equivalent to positioning relative to the page area:

657 Source

```
658 html, body { height: 100%; }  
659 div.page-div {width: 100%; height: 100%; position: relative; page-break-  
660 after: always; overflow: hidden;}  
661 div.page-div-end {width: 100%; height: 100%; position: relative; overflow:  
662 hidden;}
```

663

664

665 The following example makes use of the CSS recommended above. There is no ambiguity in the expected
666 output:

667 Source

```
668  
669 <html xmlns="http://www.w3.org/1999/xhtml">  
670 <head>  
671 <title>page-div</title>  
672 <style type="text/css">
```

```
673 @media print {
674 @page {size:auto;} /* or whatever size is desired */
675 }
676 html, body { height: 100%; }
677 div.page-div {width: 100%; height: 100%; position: relative; page-break-
678 after: always; overflow: hidden;}
679 div.page-div-end {width: 100%; height: 100%; position: relative; overflow:
680 hidden;}
681 p.textbox1 {position: absolute; left: 10mm; top: 10mm;}
682 p.textbox2 {position: absolute; left: 10mm; top: 20mm;}
683
684 </style>
685 </head>
686
687 <body>
688 <div class="page-div">
689 <p class="textbox1">contents page1</p>
690 </div>
691 <div class="page-div-end">
692 <p class="textbox2">contents page2</p>
693 <p> static position </p>
694 </div>
695 </body>
696 </html>
```

697

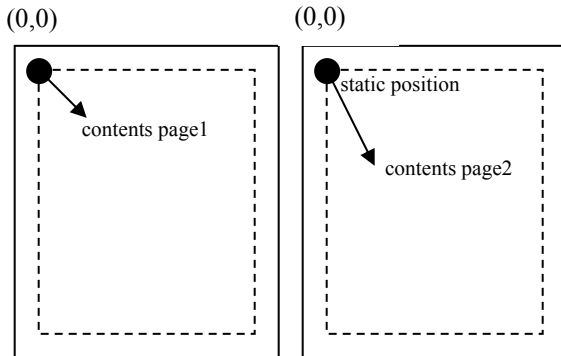

Expected Output:

698

699

700

701

702

703 **3.3.5. Images**

704 **3.3.5.1. Image Size and Page Size**

705 Consideration is recommended for the relationship between the size of the image and the page size. The size of the
 706 image should be within the size of the page size specified by @page unless it is intended that part of the image
 707 should be cropped (*i.e.*, not printed). Output consistency is not assured for images that exceed the page size.

708 When part of the image should be cropped, it is important that the overflow property be set to 'hidden', so that the
 709 printer understands it need not take steps to display the overflowed content.

710 For example, when the intrinsic aspect ratio of an image differs from the aspect ratio of the destination media, and
 711 the Content Author wishes to generate full-bleed output of the image, the width or the height of the image object
 712 may intentionally exceed the width or height of the page sheet. (Explanation is given in section 3.4, and examples
 713 are given in section 3.4.3.1.3 and 3.4.3.2.1) Information on full bleed can also be referenced in sections 3.2.2 f) and
 714 3.8.6 of PrintEnhanced:1 [PE1].

715

716 **3.3.5.2. Image Rotation**

717 The following should be taken into consideration when creating XHTML-Print / CSS Print Profile contents that
 718 include image rotation.

- 719 ● Image rotation should be specified using CSS3 rotation mechanisms. Do not rely on the EXIF App markers to
 720 rotate images.

721 Ex. CSS - `img { image-orientation:90deg; width: W; height: H; }`

722 Source image (input) expected result (output)

723

724

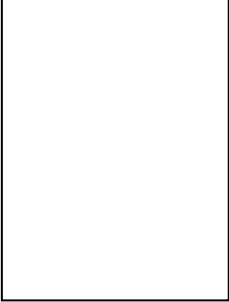

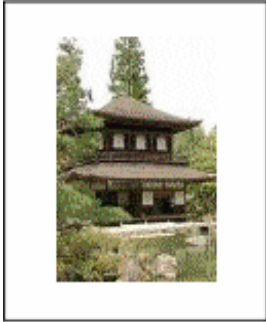

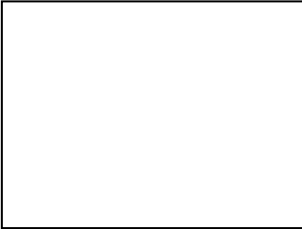

725

726 Rotate the image clockwise by 90-degree increments (90,180,270) relative to the orientation of the page

- 727 ● If both CSS rotation property and EXIF App marker exist for a given image, CSS image rotation property will
 728 take precedence over EXIF App markers

- 729 ● Whether the printer references the EXIF App markers for image rotation will be device/application dependent.

730

Orientation	source image	=90 deg
<p data-bbox="342 310 423 338">Portrait</p> 		
<p data-bbox="326 808 440 835">Landscape</p> 		

731 **3.3.5.3. URI of Images**

732 When an XHTML-Print file is sent using the HTTP POST method, either the base element should be provided if
 733 relative URIs are used, or full URIs should be specified, in order to reference external objects.

734 The following example makes use of the base element recommended above. There is no ambiguity in the expected
 735 output:

736 **Source**

```

737 <html xmlns="http://www.w3.org/1999/xhtml">
738 <head>
739 <title>URI of Images</title>
740 <base href="http://www.upnp.com/images/" />
741 </head>
742 <body>
743 <div></div>
744 </body>
745 </html>
    
```

746
 747 In the example above, given
 748 <base href="http://www.upnp.com/images/" />
 749 the IMG element

```
750 
751 refers to image
752 http://www.upnp.com/images/hdtv320x180.jpg
```

753 3.3.6. Layer Control

754 Layered presentations using static positioning and absolute positioning are described below.

755 Static positioning: In the normal flow, the block boxes can be positioned to overlap by specifying the “margin-top,
756 margin-left margin-bottom, margin-right” property. When block boxes visually overlap, those appearing later in the
757 source should be painted nearer to the user and, those appearing earlier in the source should be painted further from
758 the user.

759 Absolute positioning: The block boxes can be positioned to overlap by specifying the “top, left, bottom, right”
760 property. When block-boxes visually overlap, those appearing later in the source should be painted nearer to the
761 user and, those appearing earlier in the source should be painted further from the user.

762 The next example shows a recommended method to overlap block boxes and related components. In this example,
763 the device will likely interpret the source code shown below as follows: First, the background-color of <body> is
764 painted on the canvas, followed by <div> block box, which contains image with background color. Then, <p> block
765 box, which includes inline (explicitly specified with) text with border and background-color, is painted.
766 Expected output is illustrated below.

767 Source

```
768
769
770 <html xmlns="http://www.w3.org/1999/xhtml">
771 <head>
772 <title>Layer Control</title>
773 <style type="text/css">
774 @media print {
775 @page {size:A4 portrait;}
776 }
777 body{background-color:#87ceeb;}
778 div{width:80mm; height:50mm; background-color:green;}
779 img{width:78mm; height:48mm;}
780 p{margin-top:-1.5em; text-align:center;}
781 span{background-color:yellow; border:solid 1mm;}
782 </style>
783 </head>
784 <body>
785 <div>
786 <p><span>date&time</span></p>
787 </div>
788 </body>
789 </html>
```

792 Expected Output

793
794

795

796 **3.3.7. Elements that may Affect Output Consistency**

797 The following should be taken into consideration when creating XHTML-Print / CSS Print Profile contents
798 intended for output from PrintEnhanced:1 compliant printers.

799 **3.3.7.1. Float**

800 Usage of the float element may affect output consistency. Its usage is not recommended in situations where
801 consistency across printers is critical.

802 **3.3.7.2. List-Style-Type / List-Style-Image**

803 Usage of the List-style-type and/or List-style-image element may affect output consistency. Its usage is not
804 recommended in situations where consistency across printers is critical.

805 **3.3.7.3. Risky Margin Settings**

806 Positioning content very near the edge of the page sheet may affect output consistency among printers, due to
807 differences in the printer's Non-Printable Areas. When output consistency is important, it is recommended that
808 content be placed at a reasonable distance from the page sheet edge.

809 The use of page margins provides an easy way to ensure statically positioned content follows this guideline.

```
810     @page {
811         margin: 10mm;
812     }
```

813 Printers that follow the informative guidelines in Section 8.5 of [CSSPP] will by default establish a 10% page
814 margin.

815 However, when the page margins are used for headers and footers, the Content Author must take care to ensure the
816 header and footer contents are not placed within the Printer's Non-Printable Area.

817 **3.3.7.4. Relative Font Size**

818 Usage of relative font size may affect output consistency. Its usage is not recommended in situations where
819 consistency across printers is critical. Usage of absolute font size is recommended.

820 **3.3.7.5. Character Encoding(UTF-16)**

821 Contents creators should take in to account that printers may not support UTF-16. Usage of UTF-8 encoding is
822 recommended. For control points, PrintEnhanced:1 [PE1] defines a state variable *:DocumentUTF16Supported* that
823 can be used to determine UTF-16 support for the document format

824 **3.3.7.6. Forms**

825 It is important when designing forms that will be printed to consider the differences between printed output and
826 output displayed on a screen. The most likely usage scenario for printing forms is to create a record of a transaction.
827 In this case, it is important to explicitly control layout so that the printed output show which items were selected and
828 any text the user may have entered.

829 Text areas should be sized large enough to show all critical contents. Setting overflow to 'visible' will help ensure
830 all text that the user has entered is displayed on the printed page, but may lead to layout inconsistencies.

831 Select elements should be sized to allow all selected elements to be printed. Setting overflow to 'visible' will help
832 ensure all selected items will be displayed on the printed page, but may lead to layout inconsistencies.

833 3.4. Sample Templates

834 This section provides XHTML-Print [XHTML-PRINT] and CSS Print Profile [CSSPP] contents source and
 835 corresponding expected output description for several simple photo-related layouts. The source is intended for use
 836 as examples and reference and as a basis for modification. Be aware that the templates will not necessarily produce
 837 the expected outputs when displayed on screen"

838 3.4.1. Basic Layout Concept

839 The templates are categorized by 1) the number of images per page and 2) with borders (white space) or without
 840 borders (full bleed). Bordered output is basically achieved by the image object(s) being positioned and sized within
 841 a positive (non-zero) page margin, whereas output without borders (full bleed) are achieved by positioning the
 842 object(s) on or outside the edge of a zero-margin page box, while sizing it equal to or greater than the page size.
 843

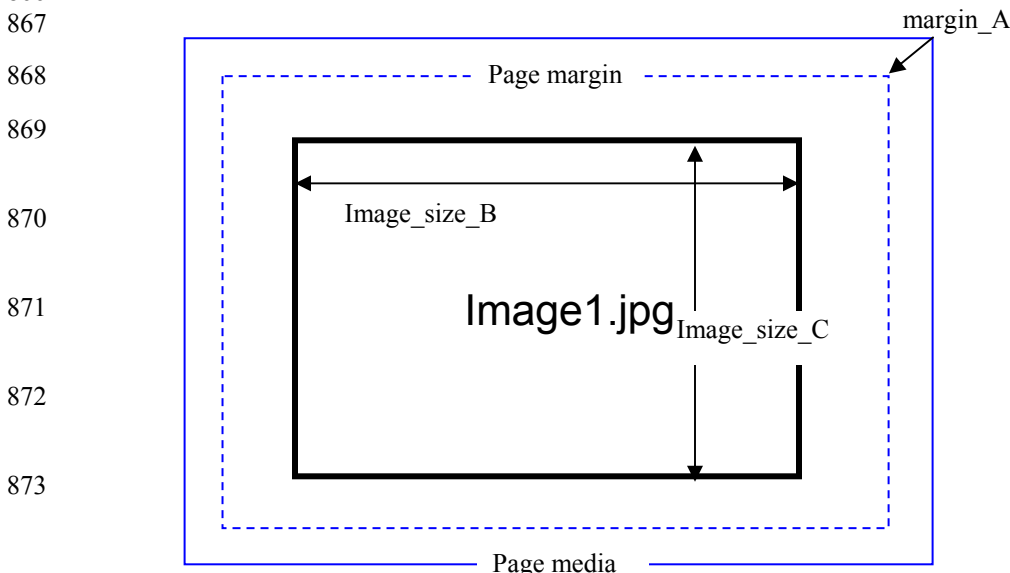

844 Output with Borders Example

```

845 <?xml version="1.0" encoding="UTF-8"?>
846 <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML-Print 1.0//EN"
847     "http://www.w3.org/MarkUp/DTD/xhtml-print10.dtd">
848 <html xmlns="http://www.w3.org/1999/xhtml">
849 <head>
850 <style>
851 @media print{
852 .....
853 @page{... margin:margin_Amm;}
854 .....
855 }
856 img.basic1{width:image_size_B; height:image_size_C;}
857
858 </style>
859 </head>
860 <body>
861 ...
862 
863 ...
864 </body>
865 </html>
    
```

set page margin to value greater than zero to achieve white space

Object size should be within the page size

874

875

876

877 **Output without Borders (Full Bleed) Example**

```

878 <?xml version="1.0" encoding="UTF-8"?>
879 <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML-Print 1.0//EN"
880 "http://www.w3.org/MarkUp/DTD/xhtml-print10.dtd">
881 <html xmlns="http://www.w3.org/1999/xhtml">
882 <head>
883 <style>
884 @media print{
885 .....
886 @page{... margin:margin_Dmm;}
887 .....
888 }
889 div {position:absolute; top:E; left:F; }
890 img.basic2{width:image_size_G; height:image_size_H;}
891
892 </style>
893 </head>
894 <body>
895 ...
896 <div>
897 
898 </div>
899 ...
900 </body>
901 </html>

```

Set page margin value to zero to achieve non borders

Object should be positioned on or outside the edge of the page.

Object size should be larger or equal to the page size. Only one of width or height should be specified to preserve the aspect ratio of the image.

904

905

906

913
914
915
916
917

The basic idea shown above can be applied to various layouts as shown below, which some of which will be shown in detail in the following sections.

918
919

920 3.4.2. Definition of Terms

921 ARp : Aspect ratio of paged media (height/width)

922 ARi : Aspect ratio of image data (pixels of a line / number of lines)

923 Note: Printer should assume square pixels in the image data, as typical image data consists of square pixels (i.e.
924 pixels with an aspect ratio of 1:1).

925

926 3.4.3. One Image in One Page

927 3.4.3.1. With Borders (with White Space)

928 3.4.3.1.1. Borders on All Sides

929 Note

- 930 ● The aspect ratio of the image is preserved.
- 931 ● The image is not cropped.
- 932 ● In order to achieve bordered output, @page margins of positive values should be specified.

993

994

995

996 **3.4.3.1.3. Case : Aligning the Vertical Edge of the Image to the Vertical Edge of the Page Media**
 997 **Without Clipping**

998 **Note**

- 999 ● The aspect ratio of the image is preserved
- 1000 ● Paper size is A4 landscape.
- 1001 ● AR_i of the image is 16/9
- 1002 ● AR_i > AR_p
- 1003 ● In order to achieve vertical zero margins, @page margins of zeros must be specified.
- 1004 ● Padding is used as a positioning directive in this particular case. Note that margins are always transparent so
 1005 the background of the elements show through, while padding areas are filled with the background specified to
 1006 the padding.
