

[MS-OXORULE]: E-Mail Rules Protocol Specification

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft's Open Specification Promise (available here: <http://www.microsoft.com/interop/osp>) or the Community Promise (available here: <http://www.microsoft.com/interop/cp/default.mspx>). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights.
- **Fictitious Names.** The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

Revision Summary

Date	Revision History	Revision Class	Comments
04/04/2008	0.1		Initial Availability.
04/25/2008	0.2		Revised and updated property names and other technical content.
06/27/2008	1.0		Initial Release.
08/06/2008	1.01		Updated references to reflect date of initial release.
09/03/2008	1.02		Revised and edited technical content.
12/03/2008	1.03		Minor editorial fixes.
04/10/2009	2.0		Updated technical content and applicable product releases.
07/15/2009	3.0	Major	Revised and edited for technical content.
11/04/2009	4.0.0	Major	Updated and revised the technical content.
02/10/2010	5.0.0	Major	Updated and revised the technical content.
05/05/2010	5.0.1	Editorial	Revised and edited the technical content.
08/04/2010	5.1	Minor	Clarified the meaning of the technical content.
11/03/2010	5.2	Minor	Clarified the meaning of the technical content.

1 Introduction

This document specifies the mechanism for manipulating incoming e-mail **messages** on a server. **Rules** are sets of **conditions** and associated **actions** that enable a user to automatically organize, categorize and act on messages as the messages are delivered to a **folder**.

This document specifies the E-mail Rules Protocol, including the following:

- The format in which a client can add, modify or delete rules on a folder.
- The format in which a client can retrieve rules set on a folder.
- Details that allow the server and the client to evaluate and execute rules.

1.1 Glossary

The following terms are defined in [\[MS-OXGLOS\]](#):

action
address book
binary large object (BLOB)
client-side rule
condition
contents table
COUNT
Deferred Action Folder (DAF)
Deferred Action Message (DAM)
Deferred Error Message (DEM)
EntryID
extended rule
FAI contents table
folder
folder associated information (FAI)
folder ID (FID)
Folder object
GUID
handle
little-endian
message
message ID (MID)
Message object
messaging object
named property
property (1)
property ID
property tag
remote operation (ROP)
restriction
ROP request buffer
ROP response buffer
rule
rules table
server-side rule
special folder
store

table Unicode

The following terms are specific to this document:

Out of Office rule: A **rule** that has the ST_ONLY_WHEN_OOF bit set in the [PidTagRuleState property](#).

Rule FAI Message: An **FAI message** stored in the Inbox **special folder** where the client can store extra rule-related information that is opaque to the server.

rule provider: A client application that created and maintains a specific **rule**. The application identifies itself using a unique, well-known string saved as a **property** on the rule.

standard rule: A **rule** that is created, modified, or deleted using the [RopModifyRules remote operation \(ROP\)](#) described in section [2.2.1](#), using the underlying [\[MS-OXCROPS\]](#) protocol.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.3 Overview

The E-Mail Rules Protocol specifies the client/server interaction that allows a messaging system to implement automatic message processing (message rules). This protocol documents a specific mechanism through which the server and the client can implement a flexible message processing system. Mail delivery is a complex operation that allows the server and the client to implement their own additional processing that is not covered by this protocol.

Rules are sets of conditions and associated actions that enable a user to automatically organize, categorize and act on messages as the messages are delivered to a folder. Rules can be set on any server folder (either public or private folders).

Rule evaluation is triggered when e-mail messages are delivered in a user's mailbox or when messages are first saved to a public folder. The clauses in a condition in a rule are evaluated against the **properties** of the incoming message. If the condition evaluates to TRUE, the rule actions are executed either by the server or by the client. If all actions in a rule can be executed by the server, the rule is said to be a **server-side rule**. If any action cannot be executed by the server (for example, the server doesn't have access to user's personal **store**, therefore it has to defer to the client any action moving messages to a personal store), the rule must be executed by the client and it is said to be a **client-side rule**.

Server-side rules are handled entirely by the messaging server, independent of the state of the messaging client. Client-side rules do not execute until the mail client connects to the particular store on the server. For each message that needs to be acted on by the client as a result of a client-side rule, the server will create a message called **Deferred Action Message (DAM)** in a **special folder** called the **Deferred Action Folder (DAF)** as specified in [\[MS-OXOSFLD\]](#).

All (enabled) rules in a folder are evaluated in sequential order, one by one, until all rules in the **rules table** for the particular folder have been evaluated. If a particular rule's conditions are met, its associated set of actions is executed. If a rule is an "exit level" rule (according to a flag in the rule state property) and the rule condition is met, then the evaluation of subsequent rules is cancelled. Otherwise, evaluation of the next rule continues even if a rule action moves the message, in which case the remaining rules continue to run against the moved message.

If the rule action is to copy or move a message to a (server) folder, the server will verify the existence of the destination folder. If the destination folder also has rules (this is not common), the server will evaluate the destination folder rules against the moved message after evaluating the remaining rules in the original folder. If the destination folder does not exist, the server will create a **Deferred Error Message (DEM)** in the DAF and the client will display an error when it processes the DEM.

When a folder is deleted, all rules set on that folder are also deleted.

This protocol specifies two slightly different types of rules: **standard rules**, which are more commonly used, and **extended rules**, which provide greater storage capacity but, for performance reasons, the server can choose to limit their usage. The way the two types of rules are created and modified differs, but they are processed identically by the server and by the client.

The following sub-sections describe the main components covered in this protocol.

1.3.1 Creating, Modifying and Deleting Rules

Standard rules are created, modified and deleted using the **remote operation (ROP)** as specified in section [2.2.1](#) using the underlying [\[MS-OXCROPS\]](#) protocol.

Extended rules are created, modified, and deleted using a **folder associated information (FAI)** message representation as specified in section [2.2.4](#) using the underlying [\[MS-OXCMSG\]](#) protocol.

1.3.2 Retrieving Rules from the Server

The messaging client can retrieve the standard rules in a folder in the form of a **table** object (see [\[MS-OXCTABL\]](#)) using the underlying ROP transport (see [\[MS-OXCROPS\]](#)) in the format specified in section [2.2.2](#).

Each row in the returned table object contains data representing one rule. The conditions, actions and other rule properties are returned as properties in the corresponding table row as specified in section [3.2.5.2](#).

To obtain a list of extended rules in a folder, the client can retrieve the **FAI contents table** for that folder. Extended rules are FAI messages identified by the value of their [PidTagMessageClass](#) property, as specified in section [2.2.4.1.2](#).

1.3.3 Executing Client-side Rules

When a rule cannot be executed entirely by the server, the client will need to complete the rule execution. The E-Mail Rule Protocol specifies how this is achieved via Deferred Actions (section [3.1.4.1](#)).

1.4 Relationship to Other Protocols

This protocol relies on an understanding of how to work with folders, messages and tables (for more details see [\[MS-OXCMSG\]](#), [\[MS-OXCSTOR\]](#) and [\[MS-OXCTABL\]](#)). The protocol also relies on understanding how ROPs are transmitted to the server using the underlying transport (see [\[MS-OXCROPS\]](#)).

Extended rules use **message objects** specified in [\[MS-OXCMSG\]](#) as an underlying transport.

1.5 Prerequisites/Preconditions

This protocol specification assumes the messaging client has previously logged on to the messaging server (see [\[MS-OXCROPS\]](#)) and has acquired a **handle** to the folder it needs to set the rules to and retrieve the rules from (see [\[MS-OXCFOLD\]](#)). This document also relies on the use of the underlying ROP transport protocol specified in [\[MS-OXCROPS\]](#).

1.6 Applicability Statement

This protocol can be used to build automatic workflows for messages that are delivered by the server into a message folder.

1.7 Versioning and Capability Negotiation

This protocol defines version 1 of the Extended Rule Actions format, as specified in section [2.2.4.2](#).

1.8 Vendor-Extensible Fields

A third party application can create its own set of rules by using its custom string as the value of [PidTagRuleProvider](#) property (specified in section [2.2.1.3.2.5](#)). There is no centralized authority that ensures uniqueness of **rule provider** strings across different client applications.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

The standard rules (sections [2.2.1](#), [2.2.2](#), and [2.2.3](#)) are built using the ROP protocol specified in [\[MS-OXCROPS\]](#). The extended rules portion of the protocol (section [2.2.4](#)) is built using the messages protocol specified in [\[MS-OXCMSG\]](#).

The **ROP request buffer** and **ROP response buffer** specified by this protocol are sent to and received from the server respectively using the underlying protocol specified by [\[MS-OXCROPS\]](#).

2.2 Message Syntax

Standard rules are the most common and typical way of specifying rules for a folder. Sections [2.2.1](#), [2.2.2](#), and [2.2.3](#) specify the ROP request buffers specific to this protocol. The syntax of these requests and responses are documented in [\[MS-OXCROPS\]](#), as specified in each section below.

Unless otherwise noted, sizes in this section are expressed in **BYTES**.

Unless otherwise noted, the fields specified in this section are packed in buffers in the order they appear in this document, without any padding in **little-endian** format.

2.2.1 RopModifyRules Format

The messaging client sends the [RopModifyRules](#) request to create, modify or delete rules in a folder.

The syntax of the [RopModifyRules](#) request and response buffers are specified in the [\[MS-OXCROPS\]](#) protocol specification. This section specifies the syntax and semantics of various fields that are not fully specified in the Remote Operations (ROP) List and Encoding Protocol Specification (see [\[MS-OXCROPS\]](#) section 2.2.11.1).

2.2.1.1 Request Buffer

2.2.1.1.1 InputHandleIndex

The index to the input handle for this operation, which is a **Folder object** handle representing the folder for which rules are to be modified.

2.2.1.1.2 ModifyRulesFlag

This is an 8-bit field with a structure specified as follows.

0	1	2	3	4	5	6	7
x	x	x	x	x	x	x	R

R: (bitmask 0x01) If this bit is set, the rules in this request are to replace existing rules in the folder; in this case, all subsequent **RuleData** structures (see section [2.2.1.3](#)) MUST have ROW_ADD as the value of their **RuleDataFlag** field (see section [2.2.1.3.1](#)). If this bit is not set, the rules specified in this request represent changes (delete, modify, add) to the rules already existing in this folder.

x: Unused. This bit MUST be set to 0 by the client and ignored by the server.

2.2.1.1.3 RulesCount

This is a WORD field whose value MUST be the number of **RuleData** structures present in the ROP request buffer.

2.2.1.1.4 RulesData Array

This is an array of **RuleData** structures that use the format specified in section [2.2.1.3](#).

2.2.1.2 Response Buffer

2.2.1.2.1 InputHandleIndex

The index to the input handle in the response buffer MUST be the same as the index to the input handle in the request buffer for this operation.

2.2.1.2.2 ReturnValue

The **ReturnValue** is a 32-bit unsigned integer value that indicates the result of the operation. To indicate success, the server MUST return 0x00000000. For a list of common error return values see [\[MS-OXCDATA\]](#) section 2.4.

2.2.1.3 RuleData Structure

The [RopModifyRules](#) request buffer MUST contain exactly the **RulesCount** number of **RuleData** buffers, as specified in [\[MS-OXCROPS\]](#) section 2.2.11.1.1.1. The format of the **RuleData** structures in the [RopModifyRules](#) request buffer is specified as follows.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
RuleDataFlags										PropertyValueCount												PropertyValue1 (variable)									
...																															
PropertyValueN (variable)																															
...																															

RuleDataFlags (1 byte): MUST be set to one of the values specified in section [2.2.1.3.1](#).

PropertyValueCount (2 bytes): The count of properties that are defined in this structure. This field MUST be greater than zero and MUST be followed by exactly **PropertyValueCount** **TaggedPropertyValue** structures.

PropertyValue1 (variable): **PropertyValue** structure containing one **property tag** and its associated value. The property tag used in this buffer MUST be among the ones specified in section [2.2.1.3.2](#). The format of the **PropertyValue** structure is a **TaggedPropertyValue** structure, as specified in [\[MS-OXCDATA\]](#), section [2.11.4](#).

PropertyValueN (variable): Last of **PropertyValueCount** **TaggedPropertyValue** structures.

2.2.1.3.1 RuleDataFlags

The **RuleDataFlags** field in the **RuleData** structure MUST have one of the following values.

Name	Value	Description
ROW_ADD	0x01	Adds the data in the rule buffer to the rule set as a new rule.
ROW_MODIFY	0x02	Modifies the existing rule identified by the value of PidTagRuleId property.
ROW_REMOVE	0x04	Removes from the rule set the rule that has the same value of the PidTagRuleId property.

2.2.1.3.2 PropertyValue Structure

This section specifies the allowed set of property tags that MUST be used in the **TaggedPropertyValue** structure.

See [\[MS-OXPROPS\]](#) and [\[MS-OXCADATA\]](#) for more details about properties, property types, and the buffer format of the **TaggedPropertyValue** structure.

2.2.1.3.2.1 PidTagRuleId

Type: **PtypInteger64**

Specifies a unique identifier the messaging server generates for each rule when the rule is first created. The client MUST NOT specify this property when creating a new rule but MUST specify it when modifying or deleting a rule.

2.2.1.3.2.2 PidTagRuleSequence

Type: **PtypInteger32**

A value used to determine the order in which rules are evaluated and executed. Rules are evaluated in sequence according to the increasing order of this value. The evaluation order for rules that have the same value in the [PidTagRuleSequence](#) property is undefined: the server can choose an arbitrary order for rules with the same value, but that does not affect the sequence of other rules.

2.2.1.3.2.3 PidTagRuleState

Type: **PtypInteger32**

A value interpreted as a bitmask combination of flags that specify the state of the rule. The value of [PidTagRuleState](#) is defined as follows.

1										2										3	
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
x	P	S	E	H	O	E	E	x	x	x	x	x	x	x	x	x	x	x	x	x	x
	E	C	L	I	F	R	N														

EN (ST_ENABLED, bit mask 0x00000001): The rule is enabled for execution. If this flag is not set, the server MUST skip this rule when evaluating rules.

ER (ST_ERROR, bit mask 0x00000002): The server has encountered any non-parsing error processing the rule. The client SHOULD NOT set this flag. The server SHOULD ignore this flag if it is set by the client.

OF (ST_ONLY_WHEN_OOF, bit mask 0x00000004): The rule is executed only when the user sets the Out of Office state on the mailbox (see [\[MS-OXWOOF\]](#) section 2.2.5.2). This flag MUST NOT be set in a public folder rule. For details on this flag, see section [3.2.4.1.1.1](#).

HI (ST_KEEP_OOF_HIST, bit mask 0x00000008): For details, see Out of Office Rule Processing in section [3.2](#). This flag MUST NOT be set in a public folder rule.

EL (ST_EXIT_LEVEL, bit mask 0x00000010): Rule evaluation will terminate after executing this rule, except for evaluation of **Out of Office rules**. For details, see Out of Office Rule Processing in section [3.2.4.1.1.1](#).

SCL (ST_SKIP_IF_SCL_IS_SAFE, bit mask 0x00000020): Evaluation of this rule will be skipped if the delivered message's [PidTagContentFilterSpamConfidenceLevel](#) property has a value of 0xFFFFFFFF.

PE (ST_RULE_PARSE_ERROR, bit mask 0x00000040): The server has encountered rule data from the client that is in an incorrect format, which caused an error parsing the rule data. The client SHOULD NOT set this flag. The server SHOULD ignore this flag if it is set by the client.

x: Unused by this protocol. Bit locations marked with x are to be set to 0, SHOULD NOT be modified by the client and are ignored by the server. [<1>](#)

2.2.1.3.2.4 PidTagRuleName

Type: **PtypString**

Specifies the name of the rule.

2.2.1.3.2.5 PidTagRuleProvider

Type: **PtypString**

Identifies the client application that owns the rule. The client MUST specify this property when adding or modifying a rule.

Rules that are stored on folders are associated with the application that owns the rules using a rule provider string. Each client application MUST only add, modify or delete rules that it is responsible for.

A messaging client can define its own rule provider string. The value of the string MUST NOT be the same as a rule provider string being used by another messaging client that could be setting rules on the same folder. [<2>](#)

2.2.1.3.2.6 PidTagRuleLevel

Type: **PtypInteger32**

This property is not used; if setting this property, the client MUST pass in 0x00000000.

2.2.1.3.2.7 PidTagRuleUserFlags

Type: **PtypInteger32**

An opaque property that the client sets for the exclusive use of the client. The server MUST preserve this value if it was set by the client but MUST ignore its contents during rule evaluation and processing.

2.2.1.3.2.8 PidTagRuleProviderData

Type: **PtypBinary**

An opaque property that the client sets for the exclusive use of the client. The server MUST preserve this value if it was set by the client but MUST ignore its contents during rule evaluation and processing.

2.2.1.3.2.9 PidTagRuleCondition

Type: **PtypRestriction**

The condition used when evaluating the rule. The condition is expressed as a **restriction** (as specified in [\[MS-OXCDATA\]](#)) and the **PropertyValue** buffer contains the restriction structure packaged as specified in [\[MS-OXCDATA\]](#) (using 2-byte sized **COUNT** values).

2.2.1.3.2.10 PidTagRuleActions

Type: **PtypRuleAction**

The set of actions associated with the rule. Its structure is specified in section [2.2.5](#), using a 2-byte sized COUNT value.

2.2.2 RopGetRulesTable Format

The syntax of the [RopGetRulesTable](#) request and response buffers are specified in [\[MS-OXCROPS\]](#) section 2.2.11.2.

The [RopGetRulesTable](#) remote operation (ROP) creates a table object through which the client can access the standard rules in a folder using table operations as specified in the [\[MS-OXCTABL\]](#) protocol. The table returned by the server MUST contain all standard rules associated with a given folder. Each row in the table MUST represent one rule.

This section specifies the syntax and semantics of various fields that are not fully specified in the [\[MS-OXCROPS\]](#) protocol.

2.2.2.1 Request Buffer

2.2.2.1.1 InputHandleIndex

The index to the input handle for this operation, which is a Folder object handle representing the folder for which rules are to be retrieved.

2.2.2.1.2 TableFlags

This is an 8-bit field as specified below.

0	1	2	3	4	5	6	7
x	U	x	x	x	x	x	x

U (bit mask 0x40): Set if the client is requesting that string values in the table to be returned as **Unicode** strings.

x: Unused. This bit MUST be set to 0 by the client and ignored by the server.

2.2.2.2 Response Buffer

2.2.2.2.1 OutputHandleIndex

The index to the output handle in the response buffer MUST be the same as the index to the input handle in the request buffer for this operation.

2.2.2.2.2 ReturnValue

The ReturnValue is a 32-bit unsigned integer value that indicates the result of the operation. To indicate success, the server MUST return 0x00000000. For a list of common error return values, see [\[MS-OXCDATA\]](#) section 2.4.

2.2.3 RopUpdateDeferredActionMessages Format

The format of the [RopUpdateDeferredActionMessages](#) request and response buffers are specified in [\[MS-OXCROPS\]](#) section 2.2.11.3.

This section specifies the syntax and semantics of various fields that are not fully specified in the [MS-OXCROPS] protocol.

2.2.3.1 Request Buffer

2.2.3.1.1 InputHandleIndex

The index to the input handle for this operation, which is a Logon object handle.

2.2.3.1.2 ServerEntryIdSize

WORD value representing the length, in bytes, of the **ServerEntryId** field.

2.2.3.1.3 ServerEntryId

Byte array representing the **EntryID** of the message on the server for which the DAM has been generated. The length of this byte array is specified by the [ServerEntryIdSize](#) field.

2.2.3.1.4 ClientEntryIdSize

WORD value representing the length, in bytes, of the **ClientEntryId** field.

2.2.3.1.5 ClientEntryId

Byte array representing the EntryID of the message downloaded by the client to which the DAM will now apply. The length of this byte array is specified by the [ClientEntryIdSize](#) field.

2.2.3.2 Response Buffer

2.2.3.2.1 InputHandleIndex

The index to the input handle in the response buffer MUST be the same as the index to the input handle in the request buffer for this operation.

2.2.3.2.2 ReturnValue

The ReturnValue is a 32-bit unsigned integer value that indicates the result of the operation. To indicate success, the server MUST return 0x00000000. For a list of common error return values, see [\[MS-OXCDATA\]](#) section 2.4.

2.2.4 Extended Rules Message Syntax

The standard rules protocol has one major limitation as a consequence of using the ROP layer as the underlying transport – there is an inherent size limitation of 32kb per ROP package. To work around this limitation, extended rules were created. Extended rules are built using the [\[MS-OXCMSG\]](#) protocol because messages, as specified in [\[MS-OXCMSG\]](#), can be spread over multiple ROPs and thus avoid the inherent size limitation. An extended rule is defined as an FAI message in a folder that MUST have the value of the [PidTagMessageClass](#) property set to "IPM.ExtendedRule.Message". This FAI message also has a set of rule-related properties set on it, as specified below. To create, modify or delete an extended rule, the application MUST create, modify or delete the underlying FAI message.

Extended rules use a different set of properties than [RopModifyRules](#). However, these properties map to properties for [RopModifyRules](#); and except where noted, their formats are identical and the same syntactic restrictions and semantic meanings of values apply as the respective property defined in section [2.2.1.3.2](#).

2.2.4.1 Properties of an Extended Rule

The following properties have a particular meaning when set on FAI messages representing an extended rule. The application can store additional meta-data in any other property on the FAI message. The server MUST ignore any properties not explicitly listed here when evaluating extended rule.

2.2.4.1.1 PidTagRuleMessageName

This string property SHOULD be set on the FAI message. This property has the same semantics as [PidTagRuleName](#) defined in section [2.2.1.3.2.4](#).

2.2.4.1.2 PidTagMessageClass

Type: **PtypString**

This property MUST be set on the FAI message, and MUST have a value of "IPM.ExtendedRule.Message".

2.2.4.1.3 PidTagRuleMessageSequence

Type: **PtypInteger32**

This property MUST be set on the FAI message. This property has the same semantics as [PidTagRuleSequence](#) defined in section [2.2.1.3.2.2](#).

2.2.4.1.4 PidTagRuleMessageState

Type: **PtypInteger32**

This property MUST be set on the FAI message. This property has the same semantics and flag meanings as [PidTagRuleState](#) defined in section [2.2.1.3.2.3](#).

2.2.4.1.5 PidTagRuleMessageUserFlags

Type: **PtypInteger32**

This property MAY be set on the FAI message. This property has the same semantics as [PidTagRuleUserFlags](#) defined in section [2.2.1.3.2.7](#).

2.2.4.1.6 PidTagRuleMessageLevel

Type: **PtypInteger32**

This property SHOULD be set on the FAI message. This property has the same semantics as [PidTagRuleLevel](#) defined in section [2.2.1.3.2.6](#).

2.2.4.1.7 PidTagRuleMessageProvider

Type: **PtypString**

This property MUST be set on the FAI message. This property has the same semantics as [PidTagRuleProvider](#) defined in section [2.2.1.3.2.5](#).

2.2.4.1.8 PidTagRuleMessageProviderData

Type: **PtypBinary**

This property MAY be set on the FAI message. This property has the same syntax and semantics as [PidTagRuleProviderData](#) defined in section [2.2.1.3.2.8](#).

2.2.4.1.9 PidTagExtendedRuleMessageActions

Type: **PtypBinary**

This property MUST be set on the FAI message. This property serves the same purpose as [PidTagRuleActions](#); however, it contains additional information about the **named properties** used. All string values contained in any part of the action buffer used to contain actions MUST be in Unicode format. The format of this property is defined in section [2.2.4.2](#).

2.2.4.1.10 PidTagExtendedRuleMessageCondition

Type: **PtypBinary**

This property MUST be set on the FAI message. This property serves the same purpose as [PidTagRuleCondition](#); however, it contains additional information about the named properties used. All string values contained in any part of this condition property value MUST be in Unicode format. The format of this property is defined in section [2.2.4.3](#). If the [PidTagExtendedRuleSizeLimit](#) property is set on the Logon object (as specified in [\[MS-OXCSTOR\]](#) section 2.2.2.1), the client MUST keep the size of the [PidTagExtendedRuleMessageCondition](#) under the value specified by the value of the [PidTagExtendedRuleSizeLimit](#) property; conversely, the server MUST return an error if the client does attempt to set a binary property whose size is above the value specified by the value of the [PidTagExtendedRuleSizeLimit](#) property. For a list of common error return values see [\[MS-OXCDATA\]](#) section 2.4.

2.2.4.2 Extended Rule Actions Format

An extended rule's [PidTagExtendedRuleMessageActions](#) property contains additional information about the version of the rule and the named properties stored in the rule action, as well as information about the actions to be performed by this rule. The format of the binary property is specified as follows.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
NamedPropertyInformation (variable)																															
...																															
RuleVersion																															
RuleActionsBuffer (variable)																															
...																															

NamedPropertyInformation (variable): Specifies information about named properties used in this action as specified in section [2.2.4.4](#).

RuleVersion (4 bytes): Specifies the extended rules version format. This document defines version 1, and thus this value MUST be set to 0x00000001.

RuleActionsBuffer (variable): A structure containing the actions to be executed when the rule condition for the rule to which these actions apply evaluates to TRUE. The format of this structure is defined in section [2.2.5](#), using a 4-byte COUNT value.

2.2.4.3 Extended Rule Condition Format

Similar to extended rule actions, extended rule conditions contain information about any named properties contained inside of them. The format of the [PidTagExtendedRuleMessageCondition](#) binary property is specified as follows.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
NamedPropertyInformation (variable)																															

...
RuleRestriction (variable)
...

NamedPropertyInformation (variable): Specifies information about named properties used in this condition as specified in section [2.2.4.4](#).

RuleRestriction (variable): A structure containing the condition to be evaluated, represented as a **Restriction** structure. The format of this **Restriction** structure is defined in [\[MS-OXCDATA\]](#) section 2.12, using a 4-byte COUNT value.

2.2.4.4 Named Property Information Format

The Named Property Information Format provides context to any named property tags which are present in the structure it precedes. For every distinct (unique) named property used in the structure it precedes, the **Named Property Information** structure MUST contain one **PropId** – **NamedProperty** pair. Each **PropId** field is a **property ID** that MUST have a value of 0x8000 or greater and uniquely identifies the named property within an extended rule.

The format of the **Named Property Information** structure is specified as follows.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
NoOfNamedProps																PropId1															
...																PropIdN															
...																NamedPropertiesSize															
...																NamedProperty (variable)															
...																															
NamedPropertyN (variable)																															
...																															

NoOfNamedProps (2 bytes): Specifies the number of named property mappings that are packed in this buffer. If no named properties are used in the structure that follows the **Named Property Information** buffer, the value of this field MUST be 0x0000.

PropId1 (4 bytes): The first **PropId** field.

PropIdN (4 bytes): The last (**NoOfNamedProps**) **PropId** field.

NamedPropertiesSize (4 bytes): The total size, in bytes, of the following fields. Only present if **NoOfNamedProps** is greater than zero.

NamedProperty (variable): Specifies the first **PropertyName** structure, whose format is specified in [\[MS-OXCDATA\]](#) section 2.6.1.

NamedPropertyN (variable): Specifies the last (**NoOfNamedProps**) **PropertyName** structures.

Note that if there are no named properties to be listed, the **Named Property Information** reduces to a 2-byte WORD value of 0x0000.

2.2.5 Rule Action Format

The rule action data buffer MUST have one or more blocks of a binary data to specify various actions of the rule, as specified in the following table. Unless explicitly specified, any protocol document referring to this section assumes a 2-byte size for the COUNT data type.

0		1		2		3		4		5		6		7		8		9		1		2		3		4		5		6		7		8		9		0		1	
NoOfActions (2-byte COUNT or 4-byte COUNT)																																									
ActionBlock1 (variable)																																									
...																																									
ActionBlockN (variable)																																									

NoOfActions (COUNT): Specifies the number of **ActionBlocks** that are packed in this buffer. This number MUST be greater than zero.

ActionBlock1 (variable length structure): Specifies an action, see section [2.2.5.1](#).

ActionBlockN (variable length structure): Specifies an action (the last of the **NoOfActions** **ActionBlock** fields).

2.2.5.1 Action Block Buffer Format

The format of an action data block buffer is specified as follows.

0		1		2		3		4		5		6		7		8		9		1		2		3		4		5		6		7		8		9		0		1	
ActionLength (2-byte COUNT or 4-byte COUNT)																																									
ActionType																	ActionFlavor																								
ActionFlavor (continued)																	ActionFlags																								
ActionFlags (continued)																	ActionData (variable)																								

ActionLength (COUNT): MUST be the cumulative length (in **BYTES**) of the subsequent fields in this **ActionBlock**.

ActionType (BYTE): Specifies the types of action (see table in section [2.2.5.1.1](#)).

ActionFlavor (DWORD): MUST be used in conjunction with specific **ActionTypes** that support it, and MUST be zero otherwise (see section [2.2.5.1.2](#)).

ActionFlags (DWORD): Client-defined flags. The ActionFlags field is used solely by the client <3>. It is not used by the server but stored only.

ActionData (variable length binary): Specifies action data based on the **ActionType**. For more details see section [2.2.5.1.3](#).

2.2.5.1.1 Action Types

The **ActionType** field MUST have one of the following values.

Name	Value	Description
OP_MOVE	0x01	Moves the message to a folder. MUST NOT be used in a public folder rule.
OP_COPY	0x02	Copies the message to a folder. MUST NOT be used in a public folder rule.
OP_REPLY	0x03	Replies to the message.
OP_OOF_REPLY	0x04	Sends an Out of Office (OOF) reply to the message.
OP_DEFER_ACTION	0x05	Used for actions that cannot be executed by the server (like playing a sound). MUST NOT be used in a public folder rule.
OP_BOUNCE	0x06	Rejects the message back to the sender.
OP_FORWARD	0x07	Forwards the message to a recipient address.
OP_DELEGATE	0x08	Assigns the message to another recipient.
OP_TAG	0x09	Adds or changes a property on the message.
OP_DELETE	0x0A	Deletes the message.
OP_MARK_AS_READ	0x0B	Sets the MSGFLAG_READ in the PidTagMessageFlags property on the message (see [MS-OXCMSG] section 2.2.1.6).

2.2.5.1.2 Action Flavors

The only action types that currently support an Action Flavor are **OP_REPLY**, **OP_OOF_REPLY** and **OP_FORWARD**. The value of **ActionFlavor** MUST be 0x00000000 if **ActionType** is not one of these values.

If **ActionType** is **OP_FORWARD**, **ActionFlavor** MUST be a combination of the bitwise flags specified as follows.

										1										2										3									
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9
x	x	x	x	T	A	N	P	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
				M	T	C	R																																

PR (bit mask 0x00000001): Preserves the sender information and indicates that the message was auto-forwarded. Can be combined with the NC **ActionFlavor** flag.

NC (bit mask 0x00000002): Forwards the message without making any changes to the message. Can be combined with PR **ActionFlavor** flag.

AT (bit mask 0x00000004): Makes the message an attachment to the forwarded message. This value **MUST NOT** be combined with other **ActionFlavor** flags.

TM (bit mask 0x00000008): Indicates that the message **SHOULD** be forwarded as a Short Message Service (SMS) text message. This value **MUST NOT** be combined with other **ActionFlavor** flags.

x: Unused. This bit **MUST** be set to 0 by the client and ignored by the server.

If **ActionType** is **OP_REPLY** or **OP_OOF_REPLY**, **ActionFlavor** **MUST** have one of the values specified in the following table (a value of 0x00000000 indicates standard reply behavior).

										1										2										3									
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1								
x	x	x	x	x	x	S	N	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x								

NS (bit mask 0x00000001): Do not send the message to the message sender (the reply template **MUST** contain recipients in this case).

ST (bit mask 0x00000002): Server will use fixed, server-defined text in the reply message and ignore the text in the reply template. This text is an implementation detail.

2.2.5.1.3 Action Data Buffer Format

The **ActionData** buffer is different for each **ActionType** and **MUST** use the appropriate format specified in this section.

2.2.5.1.3.1 OP_MOVE and OP_COPY Action Data Buffer Format

A Move/Copy action is used to move or copy an incoming message to a specified folder in the destination store. The **ActionData** buffer used in an action of type **OP_MOVE** or **OP_COPY** and the packet structure is specified as follows.

										1										2										3									
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1								
FolderInThisStore										StoreEIDSize										StoreEID (variable)																			
StoreEID (continued)										FolderEIDSize										FolderEID (variable)																			
FolderEID (continued)																																							

FolderInThisStore (BYTE): **MUST** be either 0x01 if the folder whose **entry ID** is **FolderEID** is in the server store, or 0x00 if the folder is in a different store (for example, a local store the server cannot access).

StoreEIDSize (WORD): The size of the **StoreEID** BYTE array.

StoreEID (BYTE array): The binary buffer specifies the destination store EntryID. StoreEID is specified in [\[MS-OXCDATA\]](#) section 2.2.4.3.

FolderEIDSize (WORD): The size of the **FolderEID** BYTE array.

FolderEID (BYTE array): The binary buffer specifies the destination folder's EntryID. If the value of **FolderInThisStore** is 0x01, then the structure of this field is specified in [\[MS-OXCDATA\]](#) section 2.2.4.1.

2.2.5.1.3.2 OP_REPLY and OP_OOF_REPLY Action Data Buffer Format

The Reply/OOF Reply **ActionData** buffer format is specified as follows.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
ReplyTemplateFID																															
...																															
ReplyTemplateMID																															
...																															
ReplyTemplateGUID (variable)																															
...																															

ReplyTemplateFID (8 bytes): The Reply template 8-byte **FID** (see section [3.1.4.3.5](#)).

ReplyTemplateMID (8 bytes): The Reply template 8-byte **message ID (MID)** (see section [3.1.4.3.5](#)).

ReplyTemplateGUID (variable): The **ReplyTemplateGUID** field in the Reply **ActionData** buffer is the value of the **GUID** generated by the client in the process of creating a Reply template. **ReplyTemplateGUID** is also stored on the Reply template message as the value of the [PidTagReplyTemplateId](#) property. The **ReplyTemplateGUID** field **MUST** be unique in the folder - no two Reply templates can share the same GUID. Before creating a rule that has an **OP_REPLY** or **OP_OOF_REPLY** **ActionType**, the client **MUST** first create a Reply template FAI message in the same folder as the rule. To create a Reply template, see section [3.1.4.3.5](#). For more details about working with FAI messages, see [\[MS-OXCFOLD\]](#) and [\[MS-OXCMSG\]](#).

2.2.5.1.3.3 OP_DEFER_ACTION Action Data Buffer Format

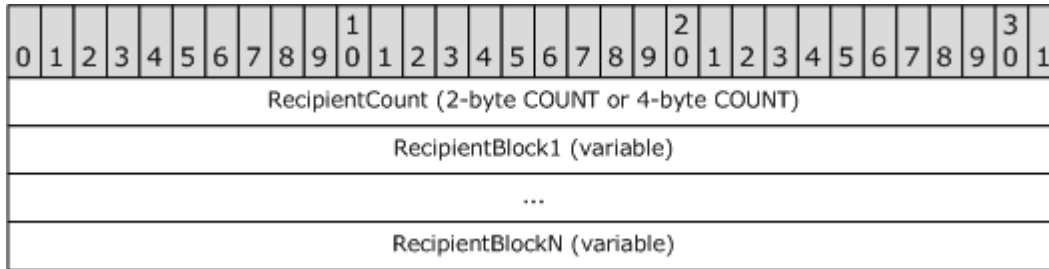

If one or more actions for a specific rule cannot be executed on the server, the rule **MUST** be a client-side rule, whose **ActionType** **MUST** be **OP_DEFER_ACTION**. Execution of the rule is postponed until the client is available.

The messaging client encodes the rule information as a client-dependent data structure designating the action to be performed. The format is client implementation dependent and contains enough information to allow the client to perform the client-side operation when requested. The size of the buffer is obtained by reading the **ActionLength** value in the **ActionBlock** containing an **OP_DEFER_ACTION** **ActionType**.

If the action type is **OP_DEFER_ACTION**, the **ActionData** buffer is completely under the control of the messaging client that created the rule. This binary buffer **MUST** be treated as an opaque **binary large object (BLOB)** by the server. When a message that satisfies the rule condition is received, the server creates a DAM and places the entire content of the **ActionBlock** as part of the [PidTagClientActions](#) property on the DAM as specified in sections [3.2.4.1.2](#), [2.2.6](#), and [2.2.6.6](#).

2.2.5.1.3.4 OP_FORWARD and OP_DELEGATE Action Data Buffer Format

The **ActionData** buffer format that MUST be used with the OP_FORWARD and OP_DELEGATE action types is specified as follows.

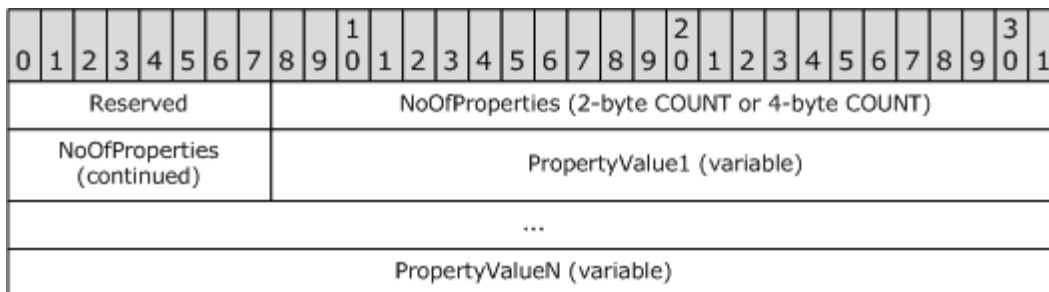

RecipientCount (COUNT): Specifies the number of recipient blocks. This number MUST be greater than zero.

RecipientBlock1 (variable length binary): Specifies recipient information. The **RecipientBlock** data buffer packet structure is specified in section [2.2.5.1.3.4.1](#).

RecipientBlockN (variable length binary): Last of **RecipientCount RecipientBlocks**.

2.2.5.1.3.4.1 RecipientBlock Data Buffer Packet Structure

The **RecipientBlock** data buffer packet structure is specified as follows.

Reserved (BYTE): MUST be set to 0x01.

NoOfProperties (COUNT): Specifies the number of properties in the block. This number MUST be greater than zero.

PropertyValue1 (variable length structure): Specifies the first TaggedPropertyValue structure.

PropertyValueN (variable length structure): Last of **NoOfProperties** TaggedPropertyValue structures.

For details about parsing the TaggedPropertyValue structure, see [\[MS-OXCDATA\]](#), section [2.11.4](#). The client MUST at a minimum specify values for the [PidTagDisplayName](#), [PidTagEmailAddress](#), and [PidTagRecipientType](#) properties in the forward/delegate **ActionData** buffer, specified in section [2.2.5.1.3.4](#).

2.2.5.1.3.5 OP_BOUNCE Action Data Buffer Format

The Bounce **ActionData** buffer format packet structure is specified as follows.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
BounceCode																															

BounceCode (4 bytes): Specifies a bounce code as specified below.

The **BounceCode** field MUST have one of the following values.

Value	Description
0x0000000D	The message was refused because it was too large.
0x0000001F	The message was refused because it cannot be displayed to the user.
0x00000026	The message delivery was denied for other reasons.

2.2.5.1.3.6 OP_TAG Action Data Buffer Format

An **OP_TAG** action Data Buffer is a **PropertyValue** structure, packaged as specified in [\[MS-OXCDATA\]](#) section 2.11.2.1.

2.2.5.1.3.7 OP_DELETE or OP_MARK_AS_READ Data Buffer Format

The incoming messages are deleted [<4>](#) or marked as read according to the **ActionType** itself. These actions have no **ActionData** buffer.

2.2.6 Deferred Action Message (DAM) Syntax

A Deferred Action Message MUST be created by the server to indicate to the client that it must further process a client-side rule action. This process is specified in section [3.2.4.1.2](#) of this document. Extended rules are not used in DAMs.

In addition to properties required on any message (as specified in [\[MS-OXCMSG\]](#) section 2.2.1), the following properties are specific to a DAM.

2.2.6.1 PidTagMessageClass

Type: **PtypString**

This property MUST be set to "IPC.Microsoft Exchange 4.0.Deferred action".

2.2.6.2 PidTagDamBackPatched

Type: **PtypBoolean**

This property MUST be set to FALSE when the DAM is generated; it MUST be set to TRUE if the DAM was updated by the server as a result of a [RopUpdateDeferredActionMessages](#) request.

2.2.6.3 PidTagDamOriginalEntryId

Type: **PtypBinary**

This property MUST be set to the EntryID of the delivered (target) message which the client has to process.

2.2.6.4 PidTagRuleProvider

Type: **PtypString**

This property MUST be set to the same value as the [PidTagRuleProvider](#) property on the rule(s) that have generated the DAM.

2.2.6.5 PidTagRuleFolderEntryId

Type: **PtypBinary**

This property MUST be set to the EntryID of the folder where the rule that triggered the generation of this DAM is stored.

2.2.6.6 PidTagClientActions

Type: **PtypBinary**

This property is a binary buffer specifying the actions the client must take on the message. The buffer MUST be packed according to the rule action Buffer format specified in section [2.2.5](#). The server MUST place in this property the relevant actions as they were set by the client when the rule was created or changed using [RopModifyRules](#). Note that the server can combine actions from different rules into one DAM, in which case the rule actions will be concatenated in the DAM's [PidTagClientActions](#) using the proper action syntax specified in section [2.2.5](#).

2.2.6.7 PidTagRuleIds

Type: **PtypBinary**

This property is a buffer obtained by concatenating the [PidTagRuleId](#) values (8-bytes each) from all the rules that contributed actions in the [PidTagClientActions](#) property. The length of this binary property MUST be a multiple of 8 bytes.

2.2.6.8 PidTagDeferredActionMessageOriginalEntryId

Type: **PtypServerId**

This property contains the server EntryId for the DAM message on the server. This property is set by the server when the DAM is created.

2.2.7 Deferred Error Message (DEM) Syntax

A Deferred Error Message SHOULD be created by the server when an error is encountered while executing a rule. This process is specified in section [3.2.4.1.3](#) of this document. Extended rules are not used in DEMs.

In addition to properties required on any message (as specified in [\[MS-OXCMSG\]](#) section 2.2.1), the following properties are specific to a DEM.

2.2.7.1 PidTagMessageClass

Type: **PtypString**

This property MUST be set to "IPC.Microsoft Exchange 4.0.Deferred Error".

2.2.7.2 PidTagRuleError

Type: **PtypInteger32**

This property MUST be set to one of the following values, indicating the cause of the error encountered during the execution of the rule.

Value	Meaning
0x00000001	Generic error that doesn't fall into any of the other categories.
0x00000002	Error opening the rules folder.
0x00000003	Error delivering the message.
0x00000004	Error while parsing the rule format.
0x00000005	Error processing the rule.
0x00000006	Error moving or copying the message to the destination folder.
0x00000007	Permission error moving or copying the message to the destination folder.
0x00000008	Error creating the Deferred Action Message.
0x00000009	Error sending as another user.
0x0000000A	Error retrieving the reply template.
0x0000000B	Generic error while executing the rule on the server.
0x0000000C	Error processing rule due to mailbox quotas.
0x0000000D	Error processing the message due to the large number of recipients.
0x0000000E	Error copying or moving a message due to folder quotas.

2.2.7.3 PidTagRuleActionType

Type: **PtypInteger32**

This property MUST be set to the **ActionType** (see Rule Action Types in section [2.2.5.1.1](#)) of the action in the rule that failed, or 0x00000000 if the failure is not specific to an action. Related property: [PidTagRuleActionNumber](#).

2.2.7.4 PidTagRuleActionNumber

Type: **PtypInteger32**

This property MUST be set to the index of the action that failed, or 0x00000000 if the failure is not specific to an action. A property value of 0x00000001 means that the first action failed. The **ActionType** of the action at this index MUST be the same value as the value of [PidTagRuleActionType](#) in this DEM.

2.2.7.5 PidTagRuleProvider

Type: **PtypString**

This property MUST be set to the same value as the [PidTagRuleProvider](#) on the rule(s) that have caused the DEM to be generated.

2.2.7.6 PidTagDamOriginalEntryId

Type: **PtypBinary**

This property MUST be set to the EntryID of the message that was being processed by the server when this error was encountered (i.e., the "delivered message").

2.2.7.7 PidTagRuleFolderEntryId

Type: **PtypBinary**

This property MUST be set to the EntryID of the folder where the rule that triggered the generation of this DEM is stored.

2.2.7.8 PidTagRuleId

Type: **PtypInteger64**

This property MUST be set to the same value as the value of the [PidTagRuleId](#) property on the rule that has generated this error.

3 Protocol Details

3.1 Client Details

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The following sections describe the high-level objects used in this protocol.

3.1.1.1 Rules Table

When manipulating or using standard rules, the client can keep an in-memory table representation of the rules. The client ensures that its representation of the rules table and the server's representation match.

3.1.1.2 Deferred Actions Contents Table

The client maintains a **contents table** that describes the DAMs and DEMs contained in the Deferred Action Folder (DAF). The client ensures that the rows in this table representing DAMs and DEMs are processed in a timely manner as specified in section [3.1.4.1](#).

3.1.2 Timers

None.

3.1.3 Initialization

Before sending any requests to the server, the client MUST have successfully logged onto the server using [RopLogon](#), and have a valid **LogonId** as specified in [\[MS-OXCROPS\]](#). Also, the client issuing the messages MUST have opened handles to the **messaging objects** used as parameters in the ROP request buffers (as specified section [2.2](#)).

3.1.4 Higher-Layer Triggered Events

3.1.4.1 Processing DAMs and DEMs

If the messaging client creates any rules, the client SHOULD check the Deferred Action Folder (DAF) for DAMs and DEMs placed in that folder and process the ones identified by the [PidTagRuleProvider](#) value the client supports. The DAF is a special folder that the server creates, as specified in section [3.2.1.3](#). The server places a message in the DAF either when it needs the client to perform an action as a result of a client-side rule (DAM) or when it encounters a problem performing an action of a server-side rule (DEM). When the server creates a DAM, it updates the [PidTagDeferredActionMessageOriginalEntryId](#), which is then used by the client in the **ServerEntryId** field of the [RopUpdateDeferredActionMessages](#) Request Buffer.

After the client connects to the server, it inspects the contents of the DAF (see [\[MS-OXCFOLD\]](#) section 3.2.5.14) for new DAMs or DEMs. The client processes DAMs and DEMs as specified in the following subsections.

3.1.4.1.1 Processing a DAM

When processing a DAM, the client MUST first determine if it has to process the DAM by inspecting the value of [PidTagRuleProvider](#) property on the DAM. If the value matches one of the rule provider strings the client supports, the client SHOULD process the DAM; otherwise, the client MUST ignore the DAM.

In addition to [PidTagRuleProvider](#), when processing a DAM the client can use any combination of the properties the server sets on the DAM as specified in section [2.2.6](#) in order to complete the execution of the rule. In particular, the client MUST use the value of [PidTagDamOriginalEntryId](#) to identify the message it needs to take action on, and it SHOULD use the value of the [PidTagClientActions](#) property to identify what actions it needs to execute on the message.

After processing a DAM, the client MUST delete the DAM. For more details about how to delete a message, see [\[MS-OXCFOLD\]](#) section 2.2.11.

3.1.4.1.2 Processing a DEM

When processing a Deferred Error Message (DEM), the client MUST first determine if it has to process the DEM by inspecting the value of [PidTagRuleProvider](#) property on the DEM. If the value matches one of the rule provider strings the client supports, the client SHOULD process the DEM at its earliest convenience; otherwise, the client MUST ignore the DEM.

In addition to [PidTagRuleProvider](#), when processing a DEM the client can use any combination of the properties the server sets on the DEM as specified in section [2.2.7](#). In particular, the client SHOULD use the value of [PidTagRuleError](#) to identify what error occurred, and it SHOULD use the values of [PidTagRuleFolderEntryId](#) and [PidTagRuleId](#) if it needs to get more information from the rules table about the rule that failed and return that information to the higher levels.

As a result of processing the DEM, the client SHOULD display an error to the user or take programmatic action as a result of a rule in error.

After processing a DEM, the messaging client MUST delete the DEM. For more details about how to delete a message, see [\[MS-OXCFOLD\]](#) section 2.2.11.

3.1.4.2 Retrieving Existing Rules

When a higher layer needs to inspect the standard rules or needs to display these rules to the user, the messaging client MUST retrieve the rules from the server using the [RopGetRulesTable](#) request as specified in section [2.2.2](#). The higher level MUST use the returned table handle, as specified in [\[MS-OXCTABL\]](#) section 1.5, to access rule properties.

The table returned by [RopGetRulesTable](#) contains one rule per row. The columns available in this table are the properties specified in section [2.2.1.3.2](#), and their values are the same the client set previously using a [RopModifyRules](#) request. If there isn't a value stored on the server for one of the rule property columns, then when the client retrieves the rule via [RopGetRulesTable](#), the server returns either a default value or an error for that column, which default values or errors are determined by the server implementation.

When a higher layer needs to inspect the extended rules or needs to display the extended rules to the user, the messaging client MUST retrieve the FAI contents table of the folder of interest and restrict the folder where [PidTagMessageClass](#) is equal to "IPM.ExtendedRules.Message". See [\[MS-OXCFOLD\]](#) section 3.1.4.12, and [\[MS-OXCTABL\]](#) section 2.2.2.4 for more details about retrieving an FAI contents table and restricting a table.

3.1.4.3 Adding, Modifying or Deleting Rules

This section describes the process of adding, modifying or deleting rules.

3.1.4.3.1 Adding, Modifying or Deleting Standard Rules

When the messaging client needs to modify standard rules as a result of user interaction, it MUST do so using [RopModifyRules](#) as specified in section [2.2.1.<5>](#)

When adding a standard rule, the client MUST NOT set a value for [PidTagRuleId](#), and MUST set values for [PidTagRuleProvider](#), [PidTagRuleCondition](#) and [PidTagRuleActions](#) properties on each rule in the ROP request buffer. The client MAY set values for [PidTagRuleUserFlags](#) and [PidTagRuleProviderData](#) for storing additional data. The client SHOULD send values for the other properties specified in section [2.2.1.3.2](#) in the ROP request buffer.

When modifying a standard rule, the client MUST send values for [PidTagRuleId](#) and MUST send values for properties that are to be changed, as specified in section [2.2.1.3.2](#).

When deleting a standard rule, the client MUST only send the value of [PidTagRuleId](#) property in the ROP request buffer.

3.1.4.3.2 Adding, Modifying or Deleting Extended Rules

To add, modify, or delete an extended rule, a messaging client adds, modifies, or deletes the FAI message representing that rule respectively. The messaging client uses standard message operations, as specified in [\[MS-OXCMSG\]](#) section 3.1.4.

When adding an extended rule, the client MUST set values for [PidTagRuleMessageName](#), [PidTagRuleMessageProvider](#), [PidTagExtendedRuleMessageCondition](#) and [PidTagExtendedRuleMessageActions](#) properties for each rule on the FAI message representing that rule. The client MAY set values for [PidTagRuleMessageUserFlags](#) and [PidTagRuleMessageProviderData](#) for storing additional data. The client SHOULD set values for the other properties on the FAI message, as specified in section [2.2.4.1](#).

When modifying an extended rule, the client MUST send values for properties that are to be changed, as specified in section [2.2.4.1](#).

When deleting an extended rule, the client MUST delete the FAI message representing that rule.

3.1.4.3.3 Public Folder Rules Considerations

The client MUST limit the conditions and actions that are available for public folders to server-side rules by only using rule actions that can be executed by the server.

3.1.4.3.4 Client-Specific Rule Metadata Storage

The client can choose to implement richer rules functionality than provided by the server (e.g. rules that are evaluated when sending a message). The client can also store additional rules metadata that is opaque to the server. If the client does have metadata associated with rules in the rules table, the client MUST store this metadata in a **Rule FAI Message** stored in the Inbox special folder (specified in [\[MS-OXOSFLD\]](#)).

The Rules FAI Message is an FAI message as specified in [\[MS-OXCMSG\]](#). The client MUST create (or open, if already present) the Rules FAI Message in the Inbox special folder. This message MUST be identified by the values of its [PidTagSubject](#) and [PidTagMessageClass](#) properties as follows: the

value of the [PidTagMessageClass](#) property MUST be set to "IPM.RuleOrganizer"; the value of the [PidTagSubject](#) property MUST be set to "Outlook Rules Organizer".

Other properties on the Rules FAI Message are completely up to the client application(s) and MUST be treated by the server as opaque. <6>

3.1.4.3.5 Creating a Reply Template

Before creating a rule that has an OP_REPLY or OP_OOF_REPLY **ActionType**, the client MUST first create a Reply template FAI message in the same folder as the rule.

The following steps specify how to create a Reply template:

1. Create a new FAI message in the folder.
2. Set the value of the [PidTagMessageClass](#) property to a string that has the prefix "IPM.Note.rules.ReplyTemplate." (for OP_REPLY) or "IPM.Note.rules.OOFTemplate." (for OP_OOF_REPLY).
3. Set the value of the [PidTagReplyTemplateId](#) property with a newly generated GUID.
4. Set the value of [PidTagSubject](#) property, the text of the message and other message properties as desired.
5. Save the newly created message.
6. Get the value of the MID and FID from the saved message.

The value of the [PidTagReplyTemplateId](#) generated by the client at step 3 above is the value used by the **ReplyTemplateGUID** field in the Reply **ActionData** buffer specified in section [2.2.5.1.3.2](#). See section [2.2.5.1.3.2](#) for the description of the Reply **ActionData** buffer and the **ReplyTemplateGUID** field.

For more details about creating and working with FAI messages, see [\[MS-OXCFOOLD\]](#) and [\[MS-OXCMSG\]](#).

3.1.4.4 Downloading a Message to a Different Store

The messaging client can download or move a message from the server to a different store. This can be accomplished by retrieving the properties on the message, creating a new message with these properties, saving the message on the different store, and deleting the message on the original server. As a result, the EntryID that uniquely identifies this message in the messaging system can change.

If the client changes the EntryID of a message that has the [PidTagHasDeferredActionMessages](#) property set to TRUE, the client MUST send a [RopUpdateDeferredActionMessages](#) to the server as specified in section [2.2.3](#), informing the server of the EntryID change, as soon as the DAM's EntryID has been updated on the client.

3.1.5 Message Processing Events and Sequencing Rules

The messages specified in section [2.2](#) of this protocol are all sent by the client. The client processes the ROP response buffer associated with each message it sends as specified in section [2.2.1.2](#), section [2.2.2.2](#), and section [2.2.3.2](#). For more information on processing ROPs associated with rules, see [\[MS-OXCROPS\]](#) section 2.2.11.

3.1.6 Timer Events

None.

3.1.7 Other Local Events

None.

3.2 Server Details

3.2.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

3.2.1.1 Rules Table

The server MUST store all rules created or modified successfully by the client and return them to the client in the form of a rules table when requested. The server MUST also parse the rules set on each folder (according to the syntax specified in section [2.2.1](#)) and evaluate and execute these rules when messages are delivered to that folder.

3.2.1.2 Out of Office State

While the mailbox is in an "Out of Office" state, for any rule that has the ST_KEEP_OOF_HIST flag set in [PidTagRuleState](#), the server SHOULD only execute the rule once, and SHOULD NOT execute the action more than once for any specific recipient (recipient in this case is the recipient of the OOF message that is triggered by the rule). The server is responsible for maintaining the recipient information needed to implement this functionality. See [\[MS-OXWOOF\]](#) for more information about Out of Office.

3.2.1.3 The Deferred Action Folder (DAF)

The messaging server MUST create a DAF special folder as specified in [\[MS-OXOSFLD\]](#) section 3.1.4.1. The DAF SHOULD support notifications on its contents table object (as specified in [\[MS-OXCFCOLD\]](#) section 3.1.4.12 and [\[MS-OXCCTABL\]](#) section 1.5).

The server MUST place all DAMs and DEMs that it creates as a result of running any rule in any folder into the DAF special folder.

3.2.2 Timers

None.

3.2.3 Initialization

Prior to any client connecting to a mailbox, the server MUST ensure that the Deferred Action Folder (DAF) has been created for that mailbox according to the specification in [\[MS-OXOSFLD\]](#) section 3.1.4.1. If a DAF for a mailbox has not been created or has not been found, then client-side rules and Deferred Error Messages (DEMs) will not be processed by the client.

3.2.4 Higher-Layer Triggered Events

3.2.4.1 Message Delivery to a Folder

When a message is delivered to a private mailbox folder (or is posted to a **public folder**), the messaging server MUST [evaluate](#) the rules that apply to the folder where the message was delivered. Note that it is possible for a rule to move the message to a folder where a different set of rules exist, in which case the server MUST apply rules recursively on the incoming message. Subsequent rules in the original folder MUST continue to execute on the moved message.

For each message delivered to a folder, the server MUST evaluate each rule in that folder in increasing order of the value of the [PidTagRuleSequence](#) property in each rule. If two or more rules have the same value for the [PidTagRuleSequence](#), the order in which the server evaluates these rules is not defined.

The server MUST only evaluate rules that are enabled, i.e. rules that have the **ST_ENABLED** flag set in the [PidTagRuleState](#) property.

The server MUST evaluate rules that have the **ST_ONLY_WHEN_OOF** flag set in the [PidTagRuleState](#) property only when the mailbox is in an "Out of Office" state as specified in [\[MS-OXWOOF\]](#) section 2.2.4.1.

When executing a rule whose condition evaluates to TRUE as per the restriction in the [PidTagRuleCondition](#) property, then the server MUST either perform the actions specified in the [PidTagRuleActions](#) property associated with that rule (in the case of a server-side rule) or generate a DAM for the client to process as specified in section [3.2.4.1.2](#). Here is what the server does when it executes each action type for an incoming message:

- **OP_MOVE:** the server MUST place a copy of the message in the folder specified in the action buffer structure and delete the original message; if multiple OP_MOVE operations apply to the same message, the server SHOULD create multiple copies of the message and then delete the original message.
- **OP_COPY:** the server MUST place a copy of the message in the folder specified in the action buffer structure.
- **OP_REPLY:** the server MUST use properties from the reply template (e.g. body text properties, recipients on the template) and from the original message (e.g. the sender of the message) to create a reply to the message and then send the reply. The server MUST NOT send a reply if the [PidTagAutoResponseSuppress](#) property on the message has the 0x00000020 bit set. The server SHOULD also avoid sending replies to automatically generated messages, which are identified by the [PidTagAutoForwarded](#) property, to avoid generating endless auto-reply loops.
- **OP_OOF_REPLY:** the server MUST behave as specified for the OP_REPLY action. In addition, the server MUST set the value of the [PidTagMessageClass](#) string property on the reply message to "IPM.Note.rules.OofTemplate.Microsoft". The server MUST NOT send a reply if the [PidTagAutoResponseSuppress](#) property on the message has the 0x00000010 bit set.
- **OP_DEFER_ACTION:** the server MUST generate a DAM as specified in section [3.2.4.1.2](#). The server MUST also set the [PidTagHasDeferredActionMessages](#) property to TRUE on the message.
- **OP_FORWARD:** the server MUST forward the message to the recipients specified in the action buffer structure.

- **OP_DELEGATE:** the server MUST re-send the message to the recipients specified in the action buffer structure. The server also MUST set the values of the following properties to match the current user's properties in the **address book**:
 - [PidTagReceivedRepresentingEntryId](#) MUST be set to the same value as the mailbox user's [PidTagEntryId](#).
 - [PidTagReceivedRepresentingAddressType](#) MUST be set to the same value as the mailbox user's [PidTagAddressType](#).
 - [PidTagReceivedRepresentingEmailAddress](#) MUST be set to the same value as the mailbox user's [PidTagEmailAddress](#).
 - [PidTagReceivedRepresentingName](#) MUST be set to the same value as the mailbox user's [PidTagDisplayName](#).
 - [PidTagReceivedRepresentingSearchKey](#) MUST be set to the same value as the mailbox user's [PidTagSearchKey](#).
 - [PidTagDelegatedByRule](#) Boolean property MUST be set to TRUE.
- **OP_BOUNCE:** the server MUST send a reply message to the sender detailing why it couldn't be delivered to the user's mailbox; the message MUST NOT appear in the user's mailbox (that is, the message MUST be deleted).
- **OP_TAG:** the server MUST set on the message the property specified in the action buffer structure.
- **OP_DELETE:** the server MUST delete the message. The server MUST stop evaluating subsequent rules on the message except for Out of Office rules.
- **OP_MARK_AS_READ:** the server MUST set the MSGFLAG_READ flag (0x00000001) in the [PidTagMessageFlags](#) property on the message.

If the server fails to execute a rule action, the server MUST generate a DEM as specified in section [3.2.4.1.3](#).

3.2.4.1.1 Out of Office Rules Processing

The server MUST evaluate and execute Out of Office rules only when the mailbox is in an "Out of Office" state (as specified in [\[MS-OXWOOF\]](#) section 2.2.4.1). All Out of Office rules MUST be specified with the **ST_ONLY_WHEN_OOF** flag in the [PidTagRuleState](#) property as specified in section [2.2.1.3.2.3](#).

If a rule has the **ST_KEEP_OOF_HIST** flag set in the [PidTagRuleState](#) property, the server MUST check if the sender of the delivered message appears in the History List of recipients for that rule. If it does, the server MUST NOT evaluate the rule. If it doesn't and the rule condition evaluates to TRUE, the server MUST add the sender to the History List of recipients for that rule in addition to executing the rule action.

3.2.4.1.1.1 Interaction between ST_ONLY_WHEN_OOF and ST_EXIT_LEVEL Flags

When the "Out of Office" state is set on the mailbox (as specified in [\[MS-OXWOOF\]](#)), and a rule condition evaluates to TRUE, and:

- the rule has the **ST_EXIT_LEVEL** flag (see section [2.2.1.3.2.3](#)) set and does not have **ST_ONLY_WHEN_OOF** flag (see section [2.2.1.3.2.3](#)) set, then the server MUST NOT evaluate

subsequent rules that do not have `ST_ONLY_WHEN_OOF` flag set, and MUST evaluate subsequent rules that have `ST_ONLY_WHEN_OOF` flag set.

Or,

- the rule has both the `ST_EXIT_LEVEL` and `ST_ONLY_WHEN_OOF` flags set, and then the server MUST NOT evaluate any subsequent rules.

3.2.4.1.2 Generating a Deferred Action Message (DAM)

A server MUST generate a DAM when a rule condition evaluates to TRUE but the server cannot perform the actions specified in the rule. When the server generates DAMs for a message, the server MUST set the value of the [PidTagHasDeferredActionMessages](#) property on the message to TRUE.

The server MUST generate the DAM in the following manner:

- Create a new message (DAM) in the DAF.
- Set the property values on the DAM as specified in section [2.2.6](#).
- Save the DAM.

The server MAY pack information about more than one **OP_DEFER_ACTION** actions for any given message into one DAM. The server SHOULD do this when there are more than one **OP_DEFER_ACTION** actions that belong to the same rule provider. The server MUST generate separate DAMs for **OP_DEFER_ACTION** actions that belong to separate rule providers.

3.2.4.1.3 Handling Errors During Rule Processing (creating a DEM)

A server SHOULD generate a DEM when it encounters an error processing a rule on an incoming message. The server SHOULD also generate a DEM if it fails to create a DAM for a specific rule.

The server MUST generate the DEM in the following manner:

- Create a new message (DEM) in the DAF.
- Set the property values on the DEM as specified in section [2.2.7](#).
- Save the DEM.

The first time the server finds a server-side rule to be in error and has generated a DEM for it, the server SHOULD set the **ST_ERROR** flag in the [PidTagRuleState](#) property of that rule. Examination of the `ST_ERROR` flag on subsequent operations is used to prevent creating multiple DEMs with the same error information.

3.2.4.2 Entering and Exiting the Out of Office State

When the mailbox enters the "Out of Office" state as specified in [\[MS-OXWOOF\]](#) section 2.2.4.1, the server MUST start processing rules marked with the **ST_ONLY_WHEN_OOF** flag in the [PidTagRuleState](#) property. The server MUST also keep a Rule History List for rules that have the **ST_KEEP_OOF_HIST** flag in the [PidTagRuleState](#) property (see section [3.2.1.2](#)).

When the mailbox exits the "Out of Office" state as specified in [\[MS-OXWOOF\]](#), the server MUST stop processing rules marked with the **ST_ONLY_WHEN_OOF** flag in the [PidTagRuleState](#) property. The server MUST also clear the Rule History List for all rules (see section [3.2.1.2](#)).

3.2.4.3 Server-side Rules Change

The server can choose to implement a user interface that allows the user to modify all or some rules. Since the functionality provided by the mail client can exceed the functionality provided by the server as explained in section [3.1.4.3.4](#), if the server modifies any rules as a result of user interaction, the server MUST also delete the client-specific Rule FAI Message defined in section [3.1.4.3.4](#). The server SHOULD warn the user making the change that doing so might lead to loss of specific rule functionality implemented by the client.

3.2.5 Message Processing Events and Sequencing Rules

The following events are processed by a messaging server implementing this protocol. Note there is no particular sequence required for the ROP processing, other than the server MUST send back a matching response for each ROP request sent by the client, as specified in [\[MS-OXCROPS\]](#).

3.2.5.1 Processing RopModifyRules

When receiving a [RopModifyRules](#) request, the server MUST parse the request according to the syntax specified in section [2.2.1](#). If the server encounters an error while parsing the request buffer, or if any data in the request buffer is incorrect, the server MUST return an error **ReturnValue** in the response buffer.

If the server successfully parses the data in the request buffer and is able to process all requests for adding, modifying and deleting rules present in the request buffer, the server MUST return 0x00000000 as the **ReturnValue** in the response buffer. The server MUST assign a value for the [PidTagRuleId](#) property for each rule that has been added by the [RopModifyRules](#) request. The value of [PidTagRuleId](#) on each rule MUST be unique in that folder. The server SHOULD also start using the newly modified rules when processing messages delivered to that folder as soon as it successfully processes the [RopModifyRules](#) request.

The server can limit the number of rules it allows a client to save on a folder. If the client attempts to create more rules than allowed by the server, the server MUST return an appropriate error **ReturnValue** code (see [\[MS-OXCDATA\]](#) section 2.4) in the return buffer (see [\[MS-OXCROPS\]](#) section 2.2.11.1).

The server MUST also update the value of the Boolean [PidTagHasRules](#) property when rules change on a folder. The value of this property MUST be set to TRUE if any rules are set in that folder and to FALSE otherwise.

3.2.5.2 Processing RopGetRulesTable

When receiving a [RopGetRulesTable](#) request, the server MUST parse the request according to the syntax specified in section [2.2.2](#). If the server encounters an error parsing the request buffer, or if any data in the request buffer is incorrect, the server MUST return an error **ReturnValue** in the response buffer. For a list of common error return values see [\[MS-OXCDATA\]](#) section 2.4.

If the server successfully parses the data in the request buffer, it MUST return 0x00000000 as the value of the **ReturnValue** in the response buffer and MUST return a valid table handle through which the client can access the folder rules using table specific ROPs defined in [\[MS-OXCTABL\]](#).

3.2.5.3 Processing RopUpdateDeferredActionMessages

When receiving a [RopUpdateDeferredActionMessages](#) request, the server MUST parse the request according to the syntax specified in section [2.2.3](#). If the server encounters an error parsing the request buffer, or if any data in the request buffer is incorrect, the server MUST return an error

ReturnValue in the response buffer. For a list of common error return values see [\[MS-OXCDATA\]](#) section 2.4.

If the server successfully parses the data in the request buffer, it MUST return 0x00000000 as the value of the **ReturnValue** in the response buffer. The server also MUST find all DAMs that have the value of [PidTagDamOriginalEntryId](#) equal to the value in the **ServerEntryId** field of the [RopUpdateDeferredActionMessages](#) request buffer (specified in section [2.2.3](#)). The server MUST then change [PidTagDamOriginalEntryId](#) on each DAM it finds to the value passed in the **ClientEntryId** field of the same request buffer. The server MUST also set the value of the [PidTagDamBackPatched](#) property to TRUE on any DAM that it changed.

3.2.6 Timer Events

None.

3.2.7 Other Local Events

None.

4 Protocol Examples

Starting with a "clean" folder (that is, a folder with no rules) here is a sample sequence of ROP request buffers and responses that a client and a server might exchange. Note that the examples listed here only show the relevant portions of the specified ROPs; this is not the final byte sequence which gets transmitted over the wire. Also note that the data for a multi-byte field appear in little-endian format, with the bytes in the field presented from least significant to most significant. Generally speaking, these ROP request buffers are packed with other ROP request buffers, compressed and packed in one or more RPC calls according to the specification in [\[MS-OXCROPS\]](#). These examples assume the client has already successfully logged onto the server and opened the folder they wish to modify the rules on. For more details, see [\[MS-OXCROPS\]](#).

Examples in this section use the following format for byte sequences:

```
0080: 45 4d 53 4d 44 42 2e 44-4c 4c 00 00 00 00 00 00
```

The value at the far left is the offset of the following bytes into the buffer, expressed in hexadecimal notation. Following the offset is a series of up to 16 bytes, with each two-character sequence describing the value of one byte in hexadecimal notation. Here, for example, the byte "53" (01010011) is located 0x82 bytes (130 bytes) from the beginning of the buffer. The dash between eighth byte ("44") and ninth byte ("4c") bytes has no semantic value, and serves only to distinguish the eight byte boundary for readability purposes.

Such a byte sequence is then followed by one or more lines interpreting it. In larger examples the byte sequence is shown once in its entirety and then repeated in smaller chunks, with each smaller chunk interpreted separately.

The following example shows how a "Property Tag" and its "Property Value" are represented in a buffer and interpreted directly from it (according to the **Property Value** structure format specified in [\[MS-OXCDATA\]](#)). The data appears in the buffer in little-endian format.

```
0021: 03 00 76 66 0a 00 00-00
```

Property Tag: 0x66760003 ([PidTagRuleSequence](#))

Property Value: 10

Generally speaking, interpreted values will be shown in their native format, interpreted from the raw byte sequence as described in the specific section. Here, the byte sequence "0a 00 00 00" has been interpreted as a **ULONG** with a value of 10 because the type of the [PidTagRuleSequence](#) property is **ULONG**.

4.1 Adding a New Rule

In this example, the client wishes to add a rule to move emails to a folder named "X" when the subject contains the phrase "Project X". The client sends a [RopModifyRules](#) request, using the buffer format specified in section [2.2.1](#).

4.1.1 Client Request Buffer

A complete ROP request buffer in this example would look like:

```
0000: 41 00 01 00 01 00 01 08-00 1f 00 82 66 50 00 72
0010: 00 6f 00 6a 00 65 00 63-00 74 00 20 00 58 00 00
0020: 00 03 00 76 66 0a 00 00-00 03 00 77 66 01 00 00
0030: 00 fd 00 79 66 03 01 00-01 00 1f 00 37 00 1f 00
0040: 37 00 50 00 72 00 6f 00-6a 00 65 00 63 00 74 00
0050: 20 00 58 00 00 00 fe 00-80 66 01 00 d0 00 01 00
0060: 00 00 00 00 00 00 00 01-ad 00 00 00 00 00 38 a1
0070: bb 10 05 e5 10 1a a1 bb-08 00 2b 2a 56 c2 00 00
0080: 45 4d 53 4d 44 42 2e 44-4c 4c 00 00 00 00 00 00
0090: 00 00 1b 55 fa 20 aa 66-11 cb 9b c8 00 aa 00 2f
00a0: c4 5a 0c 00 00 00 4f 4c-45 58 44 4f 47 31 32 00
00b0: 2f 6f 3d 46 69 72 73 74-4f 72 67 61 6e 69 7a 61
00c0: 74 69 6f 6e 2f 6f 75 3d-45 78 63 68 61 6e 67 65
00d0: 20 41 64 6d 69 6e 69 73-74 72 61 74 69 76 65 20
00e0: 47 72 6f 75 70 20 28 46-59 44 49 42 4f 48 46 32
00f0: 33 53 50 44 4c 54 29 2f-63 6e 3d 52 65 63 69 70
0100: 69 65 6e 74 73 2f 63 6e-3d 74 65 72 72 79 6d 61
0110: 68 44 31 32 2d 31 00 15-00 01 04 00 00 00 01 72
0120: 00 0c 00 00 00 00 00 00-00 00 00 00 00 00 1f 00
0130: 81 66 52 00 75 00 6c 00-65 00 4f 00 72 00 67 00
0140: 61 00 6e 00 69 00 7a 00-65 00 72 00 00 00 03 00
0150: 83 66 00 00 00 00 02 01-84 66 10 00 01 00 00 00
0160: 01 00 00 00 55 55 55 55-d1 44 e3 40
```

The first six bytes refer to the **RopId**, **LogonId**, **InputHandleIndex**, **ModifyRulesFlags**, and **RulesCount** fields of the [RopModifyRules](#) format as described in [\[MS-OXCROPS\]](#).

```
0000: 41 00 01 00 01 00
```

RopId: 0x41 ([RopModifyRules](#))

LogonId: 0x00

InputHandleIndex: 0x01

ModifyRulesFlags: 0x00

RulesCount: 0x0001

The first and only **RuleData** structure for this request begins at byte 0x0006. The next 3 bytes are the **RuleModificationFlags** and **RulePropertyCount** fields:

```
0006: 01 08 00
```

RuleModificationFlags: 0x01 (ROW_ADD)

RulePropertyCount: 0x0008

The first of eight **TaggedPropertyValues** begin at byte 0x0009. They are summarized below. For more details on **PropertyValue** structure format, see [\[MS-OXCADATA\]](#).

```
0009: 1f 00 82 66 50 00 72 00-6f 00 6a 00 65 00 63-00
```

0019: 74 00 20 00 58 00 00 00

PropertyTag: 0x6682001f ([PidTagRuleName](#))

PropertyValue: Unicode string: "Project X"

0021: 03 00 76 66 0a 00 00-00

PropertyTag: 0x66760003 ([PidTagRuleSequence](#))

Property Value: 0x0000000a

0029: 03 00 77 66 01 00 00-00

PropertyTag: 0x66770003 ([PidTagRuleState](#))

PropertyValue: 0x00000001 (ST_ENABLED)

0031: fd 00 79 66 03 01 00 01-00 1f 00 37 00 1f 00 37

0041: 00 50 00 72 00 6f 00 6a-00 65 00 63 00 74 00 20

0051: 00 58 00 00 00

PropertyTag: 0x667900fd ([PidTagRuleCondition](#))

PropertyValue: RES_CONTENT condition, FuzzyLevel of 0x00010001 (FL_SUBSTRING | FL_IGNORECASE), where PropertyTag 0x0037001f ([PidTagSubject](#)) contains "Project X". For more details, see section [2.2.2](#).

0056: fe 00 80 66 01 00 d0 00-01 00 00 00 00 00 00 00

0066: 00 01 ad 00 00 00 00 00-38 a1 bb 10 05 e5 10 1a

0076: a1 bb 08 00 2b 2a 56 c2-00 00 45 4d 53 4d 44 42

0086: 2e 44 4c 4c 00 00 00 00-00 00 00 00 1b 55 fa 20

0096: aa 66 11 cb 9b c8 00 aa-00 2f c4 5a 0c 00 00 00

00a6: 4f 4c 45 58 44 4f 47 31-32 00 2f 6f 3d 46 69 72

00b6: 73 74 4f 72 67 61 6e 69-7a 61 74 69 6f 6e 2f 6f

00c6: 75 3d 45 78 63 68 61 6e-67 65 20 41 64 6d 69 6e

00d6: 69 73 74 72 61 74 69 76-65 20 47 72 6f 75 70 20

00e6: 28 46 59 44 49 42 4f 48-46 32 33 53 50 44 4c 54

00f6: 29 2f 63 6e 3d 52 65 63-69 70 69 65 6e 74 73 2f

0106: 63 6e 3d 74 65 72 72 79-6d 61 68 44 31 32 2d 31

0116: 00 15 00 01 04 00 00 00-01 72 00 0c 00 00 00 00

0126: 00 00 00 00 00 00 00 00

PropertyTag: 0x668000fe ([PidTagRuleActions](#))

PropertyValue: 0x0001 actions, 0x00d0 bytes long, to ActionType is 0x01 (OP_MOVE), ActionFlavor is 0x00000000, ActionFlags is 0x00000000, FolderInThisStore is 0x01, followed by a StoreEID 0xad bytes long, followed by a FolderEID 0x15 bytes long. For more details, see section [2.2.5](#).

```
012e: 1f 00 81 66 52 00 75 00-6c 00 65 00 4f 00 72 00
013e: 67 00 61 00 6e 00 69 00-7a 00 65 00 72 00 00 00
```

PropertyTag: 0x6681001f ([PidTagRuleProvider](#))

PropertyValue: Unicode string: "RuleOrganizer"

```
014e: 03 00 83 66 00 00 00 00
```

PropertyTag: 0x66830003 ([PidTagRuleLevel](#))

PropertyValue: 0x00000000

```
0156: 02 01 84 66 10 00 01 00-00 00 01 00 00 00 55 55
0166: 55 55 d1 44 e3 40
```

PropertyTag: 0x66840102 ([PidTagRuleProviderData](#))

PropertyValue: binary large object (BLOB), 0x0010 bytes long, set by the client.

4.1.2 Server Responds to Client Request

A complete ROP response buffer in this example would look like:

```
0000: 41 01 00 00 00 00
```

ROPid: 0x41 ([RopModifyRules](#))

InputHandleIndex: 0x01

ReturnValue: 0x00000000. This response indicates the client has successfully created the rule.

4.2 Displaying Rules to the User

In this example, the client wishes to display a list of active rules on a folder to the user. The client sends a [RopGetRulesTable](#) request, using the buffer format specified in section [2.2.2](#). The client also sends [RopSetColumns](#) and [RopQueryRows](#) requests, using the buffer format specified in [\[MS-OXCROPS\]](#) and [\[MS-OXCTABL\]](#).

4.2.1 Client Request for a Rules Table

A complete ROP request buffer to request a rules table would look like:

```
0000: 3f 00 00 01 40
```

ROPid: 0x3f ([RopGetRulesTable](#))

LogonId: 0x00

InputHandleIndex: 0x00

OutputHandleIndex: 0x01

TableFlags: 0x40 (specifying a Unicode table)

The client can also simultaneously send other ROP request buffers (in the same RPC) to format the table or get rows from it. These further requests can reference the OutputHandleIndex handle index (1 in this example) to specify the table to act on. For more details, see [\[MS-OXCROPS\]](#) and [\[MS-OXCADATA\]](#).

In this case the client is interested in formatting the table and reading its rows, so the client also sends a [RopSetColumns](#) request:

```
0000: 12 00 01 00 03 00 14 00-74 66 02 01 84 66 1f 00
0010: 82 66
```

ROPid: 0x12 ([RopSetColumns](#))

LogonId: 0x00

InputHandleIndex: 0x01

WantAsync: 0x00 (Wait)

PropertyTagCount: 3

PropertyTag1: 0x66740014 ([PidTagRuleId](#))

PropertyTag2: 0x66840102 ([PidTagRuleProviderData](#))

PropertyTag3: 0x6682001f ([PidTagRuleName](#))

The client also sends a [ROPQueryRows](#) request, to gather rows from the table:

```
0000: 15 00 01 00 01 32 00
```

ROPid: 0x15 ([ROPQueryRows](#))

LogonId: 0

InputHandleIndex: 1

WantCurrentRow: False (Advance)

WantForwardRead: True (forward reading)

RowCount: 50

In this example, the handle array at the end of the RPC contains:

```
0000: 23 02 00 00 ff ff ff ff
```

Handle Index 0: 0x00000223

Handle Index 1: 0xffffffff

Note that Handle Index 0 is referenced only in the [RopGetRulesTable](#) request – it refers to a table handle previously returned by [RopOpenFolder](#) (the Inbox, for example). Handle Index 1 is referenced by the [RopGetRulesTable](#) (as the new rules table index), [RopSetColumns](#) (as the referenced table) and [RopQueryRows](#) (as the referenced table) calls. The actual server handle does not yet exist, so the client fills in 0xffffffff temporarily.

4.2.2 Server Responds to Client Requests

The client has sent three separate ROP request buffers ([RopGetRulesTable](#), [RopSetColumns](#), and [RopQueryRows](#)) and the server responds with three ROP response buffers:

```
0000: 3f 01 00 00 00 00
```

ROPid: 0x3f ([RopGetRulesTable](#))

InputHandleIndex: 1

ReturnValue: 0x00000000. This response indicates the client has successfully gotten a handle to the rules table for the specified folder.

```
0000: 12 01 00 00 00 00 00
```

ROPid: 0x12 ([RopSetColumns](#))

InputHandleIndex: 1

ReturnValue: 0x00000000. This response indicates the client has successfully set the columns of the rules table.

CompletionStatus: 0x00 (TBLSTAT_COMPLETE)

The response to [RopQueryRows](#) is slightly more verbose:

```
0000: 15 01 00 00 00 00 02 01-00 00 01 00 00 00 01 3f
0010: f8 56 10 00 01 00 00 00-01 00 00 00 55 55 55
0020: d1 44 e3 40 50 00 72 00-6f 00 6a 00 65 00 63 00
0030: 74 00 20 00 58 00 00 00
```

The first nine bytes of a [RopQueryRows](#) response contain data about the response:

```
0000: 15 01 00 00 00 00 02 01-00
```

ROPid: 0x15 ([RopQueryRows](#))

InputHandleIndex: 1

ReturnValue: 0x00000000. This response indicates the [RopQueryRows](#) call was successful.

Bookmark: 0x02 (BOOKMARK_END)

RowCount: 1

This is followed by the RowPropertyArray beginning at byte 0x0009, which in this example contains one row (indicated by RowCount above). It is not possible to interpret this response without the context of the earlier [RopSetColumns](#) request as its format is based on the number of requested columns and the data type of each column.

```
0009: 00 01 00 00 00 01 3f f8-56 10 00 01 00 00 00 01
0019: 00 00 00 55 55 55 55 d1-44 e3 40 50 00 72 00 6f
0029: 00 6a 00 65 00 63 00 74-00 20 00 58 00 00 00
```

HasError: False

Property1: 0x56f83f0100000001

Property2: 0x10 byte binary array

Property3: "Project X"

Property1, Property2, and Property3 correspond to [PidTagRuleId](#), [PidTagRuleProviderData](#), and [PidTagRuleName](#) as specified by the earlier RopSetColumn request. For more details see [\[MS-OXCROPS\]](#) and [\[MS-OXCTABL\]](#).

At the end of the three ROP response buffers, the handle table is:

```
0000: 23 02 00 00 21 02 00 00
```

Handle 0: 0x00000223

Handle 1: 0x00000221

Note that the server has returned a proper handle for the rules table (0x00000221). The client uses this handle for any further requests relating to the rules table.

4.3 Deleting a Rule

In this example, the client wishes to delete the rule created in section [4.1](#) using [RopModifyRules](#). The client sends a [RopModifyRules](#) request, using the buffer format specified in section [2.2.1](#).

4.3.1 Client Request Buffer

A complete ROP request buffer in this example would look like:

```
0000: 41 00 00 00 01 00 04 01-00 14 00 74 66 01 00 00
0010: 00 01 3f f8 56
```

The first six bytes refer to the **RopId**, **LogonId**, **InputHandleIndex**, **ModifyRulesFlags**, and **RulesCount** fields of the [RopModifyRules](#) format as described in section [2.2.1](#).

0000: 41 00 00 00 01 00

RopId: 0x41 ([RopModifyRules](#))

LogonId: 0x00

InputHandleIndex: 0x00

ModifyRulesFlags: 0x00

RulesCount: 0x0001

The first and only **RuleData** structure for this request begins at byte 0x0006. The next 3 bytes are the **RuleModificationFlags** and **RulePropertyCount** fields:

0006: 04 01 00

RuleModificationFlags: 0x04 (ROW_REMOVE)

RulePropertyCount: x0001

The only **TaggedPropertyValue** begins at byte 0x0009. It is summarized below. For more details on property packing, see [\[MS-OXCDATA\]](#).

0009: 14 00 74 66 01 00 00 00-01 3f f8 56

PropertyTag: 0x66740014 ([PidTagRuleId](#))

PropertyValue: 0x56f83f0100000001

4.3.2 Server Responds to Client Request

A complete ROP response buffer in this example would look like:

0000: 41 00 00 00 00 00

ROPid: 0x41 ([RopModifyRules](#))

InputHandleIndex: 0x00

ReturnValue: 0x00000000. This response indicates the client has successfully removed the rule.

5 Security

5.1 Security Considerations for Implementers

There are no special security considerations specific to this protocol. General security considerations pertaining to the underlying RPC-based transport apply (see [\[MS-OXCROPS\]](#)).

5.2 Index of Security Parameters

None.

6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products:

- Microsoft® Office Outlook® 2003
- Microsoft® Exchange Server 2003
- Microsoft® Office Outlook® 2007
- Microsoft® Exchange Server 2007
- Microsoft® Outlook® 2010
- Microsoft® Exchange Server 2010

Exceptions, if any, are noted below. If a service pack number appears with the product version, behavior changed in that service pack. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that product does not follow the prescription.

[<1> Section 2.2.1.3.2.3](#): Exchange 2007 implementation uses bit flags 0x00000080 and 0x00000100 to store information about Out of Office functionality; these bit flags are ignored by Office Outlook 2003 and by Exchange 2003. Bit flag 0x00000080 is used to disable a specific Out of Office rule on Exchange 2007. Bit flag 0x00000100 has the same semantics as bit flag ST_ONLY_WHEN_OOF on Exchange 2007. The rest of the flags are reserved for future use.

[<2> Section 2.2.1.3.2.5](#): Office Outlook 2003, Office Outlook 2007, Exchange 2003, and Exchange 2007 define the following well-known rule provider strings:

"MSFT:TDX Rules" (used by public folder rules)

"MSFT:TDX OOF rules" (used by Out of Office rules in the Inbox)

"RuleOrganizer" + user defined string (user-defined rules in the Inbox special folder)

"Schedule+ EMS Interface" (used to assist with delegates)

"JunkEmailRule" (rule created to help with Junk Email filtering)

"MSFT:MR" (rule assisting the "Moderator" role on a public folder)

"MSFT:Public.Folder.FormRestrictions" (used by public folder rules)

"ExchangeMailboxRules14" (rules specific to Exchange 2010; rules with this provider string are not processed by Office Outlook 2003 or Office Outlook 2007)

[<3> Section 2.2.5.1](#): Office Outlook 2003, Office Outlook 2007, and Outlook 2010 set the ActionFlags field to 0x00000000.

[<4> Section 2.2.5.1.3.7](#): Exchange 2003, Exchange 2007, and Exchange 2010 perform a "hard delete" as specified in [\[MS-OXCFOLD\]](#), but this is not required for the protocol.

<5> [Section 3.1.4.3.1](#): Office Outlook 2003 and Office Outlook 2007 are only adding, modifying, and deleting rules on the folders noted below, and ignores rules set on any other folder(s).

- The Inbox special folder, as specified in [\[MS-OXOSFLD\]](#).
- Any public folder, as specified in [\[MS-OXCSTOR\]](#) where the user has access permissions; extended rules are not set or evaluated on public folders.

<6> [Section 3.1.4.3.4](#): Office Outlook 2003, Office Outlook 2007, and Outlook 2010 use a stream property on the Rules Associated Message to store additional rule data that is opaque to the server. The property tag for this property is 0x68020102 ([PidTagRwRulesStream](#)). Other mail clients can use other opaque properties on the Rules Associated Message for storing client-specific rules data.

<7> [Section 3.2.4.1](#): Exchange 2003 by default will only process the first extended rule it encounters per folder. Other extended rules are ignored. Exchange 2007 by default will only process the first two extended rules it encounters per folder. These settings are configurable by the administrator.

7 Change Tracking

This section identifies changes that were made to the [MS-OXORULE] protocol document between the August 2010 and November 2010 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- An extensive rewrite, addition, or deletion of major portions of content.
- Changes made for template compliance.
- Removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the language and formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical or language changes were introduced. The technical content of the document is identical to the last released version, but minor editorial and formatting changes, as well as updates to the header and footer information, and to the revision summary, may have been made.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.

- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- New content added for template compliance.
- Content updated for template compliance.
- Content removed for template compliance.
- Obsolete document removed.

Editorial changes are always classified with the change type "Editorially updated."

Some important terms used in revision type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact protocol@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change Type
3.2.4.1 Message Delivery to a Folder	55785 Added clarification to OP_REPLY action.	N	Content updated.
