# 1 Introduction

This document specifies the Autodiscover Publishing and Lookup SOAP-Based Web Service protocol, which is used to send request-response messages for retrieving user settings configuration information. Clients use this protocol and the Autodiscover service (autodiscovery) to obtain specific configuration settings by passing in their e-mail addresses as simple strings.

The Autodiscover service can then be used to discover and configure internal and external URLs for the server's Web services during profile setup and later sessions with the computer that has the Client Access server role installed.

## 1.4 Relationship to Other Protocols

The Autodiscover Publishing and Lookup SOAP-Based Web Service protocol uses SOAP over HTTP and SOAP over **HTTPS**, as shown in the following figures.

**Figure 1: Autodiscover Publishing and Lookup SOAP-Based Web Service protocol HTTP stack**

**Figure 2: Autodiscover Publishing and Lookup SOAP-Based Web Service protocol HTTPS stack**

## 1.5 Prerequisites/Preconditions

None.

## 1.6 Applicability Statement

The Autodiscover Publishing and Lookup SOAP-Based Web Service protocol is applicable to environments in which a client can perform an autodiscovery of a user's configuration data by providing the user's e-mail address and using the server's Web services.

## 1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following areas:

- **Supported Transports:** This protocol uses SOAP 1.1.
- **Protocol Versions:** This protocol has only one **WSDL port type** version.
- **Security and Authentication Methods:** This protocol relies on the Web server that hosts the application to perform authentication. The server will not allow unauthenticated clients to access the Voice Mail Settings Web Service protocol operations.
- **Capability Negotiation:** This protocol does not perform explicit capability negotiation. This protocol relies on the Autodiscover Publishing and Lookup protocol [\[MS-OXDSCLI\]](#) to identify the protocol versions and service **endpoint** that are applicable to a particular client.

## 1.8 Vendor Extensible Fields

None.

## 1.9 Standards Assignments

None.

## 2 Messages

### 2.1 Transport

Messages are transported by using SOAP version 1.1. For details, see [\[SOAP1.1\]](#).

This protocol relies on the Web server that hosts the application to perform authentication. The protocol SHOULD use secure communication via HTTPS, as defined in [\[RFC2818\]](#).

### 2.2 Common Message Syntax

This section contains common definitions that are used by this protocol. The syntax of the definitions uses **XML schema** as defined in [\[XMLSCHEMA1\]](#) and [\[XMLSCHEMA2\]](#), and **Web Services Description Language (WSDL)** as defined in [\[WSDL\]](#).

#### 2.2.1 Namespaces

This specification defines and references various **XML namespaces** by using the mechanisms specified in [\[XMLNS\]](#). Although this specification associates a specific XML namespace prefix for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

Prefix	Namespace URI	Reference

### 3 Protocol Details

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

##### 3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that specified in this document.

#### 3.1.4.2 GetFederationInformation

The **GetFederationInformation** operation provides information about the federation status of the specified organization, such as the target **URI** to be used when requesting tokens targeted at this organization, and the other domains that the organization has also federated. When the caller doesn't know the URL to use to communicate with the server that hosts the domain of interest, the

caller MUST execute either of the following two means to reach the server that can provide the information.

**Direct attempt:**

- Compose URLs for Autodiscover endpoints, where {0} is the domain of interest, in the following order:
  - U1: <https://autodiscover.{0}/autodiscover/autodiscover.svc>
  - U2: <https://{0}/autodiscover/autodiscover.svc>
- Call the **GetFederationInformation** method at the Autodiscover endpoints U1 and U2. Use the results from the first discovered URL that provides a successful response.
- Follow HTTP 302 redirects only to HTTPS URLs.

**Indirect attempt:**

- Probe for an HTTP 302 redirect on a non-Secure Sockets Layer (SSL) endpoint.
- Compose the URL for an Autodiscover endpoint, where {0} is the domain of interest:  
<http://autodiscover.{0}/autodiscover/autodiscover.xml>

The response MUST be an HTTP 302 redirect. The redirect URL in response MUST start with <https://> and end with </autodiscover/autodiscover.xml>.

- Parse the host element of the URL and compose the following URL, where {0} is the host element of the previous URL:  
<https://{0}/autodiscover/autodiscover.svc>
- Call the **GetFederationInformation** method at the Autodiscover endpoint.
- Follow HTTP 302 redirects only to HTTPS URLs.

The following example shows the result of a **GetFederationInformation** operation.

```
<wsdl:operation name="GetFederationInformation">
  <wsdl:input wsaw:Action="http://schemas.microsoft.com/exchange/2010/

## 4 Protocol Examples

The code examples provided in the following subsections are examples of an autodiscovery request and response, using the **GetDomainSettings** (section [3.1.4.1](#)), **GetFederationInformation** (section [3.1.4.2](#)), and  **GetUserSettings** (section [3.1.4.4](#)) operations, respectively. Note that in the **GetDomainSettings** and  **GetUserSettings** examples, only the specified settings are returned to the client.

### 4.1 GetDomainSettings\_Example

The two examples in this section show how to construct the request XML and response XML for the **GetDomainSettings** (section [3.1.4.1](#)) operation.

To retrieve the specified domain settings, the client constructs the Autodiscover request XML and sends it to the server, as shown in the following example.

```
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:a="http://schemas.microsoft.com/exchange/2010/Autodiscover"
    xmlns:wsa="http://www.w3.org/2005/08/addressing"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
    <soap:Header>
        <a:RequestedServerVersion>Exchange2010</a:RequestedServerVersion>

scover/GetDomainSettings</wsa:Action>
        <wsa:To>https://autodiscover.exchange.microsoft.com/autodiscover/autodisco
ver.svc</wsa:To>
    </soap:Header>
    <soap:Body>
        <a:GetDomainSettingsRequestMessage xmlns:a="http://schemas.microsoft.com/e
xchange/2010/Autodiscover">
            <a:Request>
                <a:Domains>
                    <a:Domain>Redmond</a:Domain>
                </a:Domains>
                <a:RequestedSettings>
                    <a:Setting>ExternalEwsUrl</a:Setting>
                </a:RequestedSettings>
            </a:Request>
        </a:GetDomainSettingsRequestMessage>
    </soap:Body>
</soap:Envelope>
</EwsLogEntry>
```

The server then constructs the Autodiscover response XML and sends it to the client, as shown in the following example.

```
<s:Envelope xmlns:s="http://schemas.xmlsoap.org/soap/envelope/" xmlns:a="http:

</s:Envelope>

## 4.2 GetFederationInformation\_Example

The two examples in this section show how to construct the request XML and response XML for the **GetFederationInformation** (section 3.1.4.2) operation.

In the request, the caller is requesting domain information for domain “contoso.com”, as shown in the following example.

```

<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:exm="http://schemas.microsoft.com/exchange/services/2006/messages"
  xmlns:ext="http://schemas.microsoft.com/exchange/services/2006/types"
  xmlns:a="http://www.w3.org/2005/08/addressing"
  xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

```

<soap:Body>
  <GetFederationInformationRequestMessage

    </Request>
  </GetFederationInformationRequestMessage>
</soap:Body>
</soap:Envelope>

```

The server then constructs the response XML and sends it to the client, as shown in the following example.

```

<s:Envelope xmlns:s="http://schemas.xmlsoap.org/soap/envelope/">
  <ns1:Header xmlns:ns1="http://www.w3.org/2005/08/addressing">

### 4.3 GetUserSettings\_Example

The two examples in this section show how to construct the request XML and response XML for the  **GetUserSettings** (section [3.1.4.4](#)) operation.

To retrieve the requested user settings, the client constructs the Autodiscover request XML and sends it to the server, as shown in the following example.

```

<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:a="http://schemas.microsoft.com/exchange/2010/Autodiscover"
  xmlns:wsa="http://www.w3.org/2005/08/addressing" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

    </soap:Header>
    <soap:Body>
        <a: GetUserSettingsRequestMessage xmlns:a="http://schemas.microsoft.com/exchange/2010/Autodiscover">

                        <a:Mailbox>tadam@exchange.microsoft.com</a:Mailbox>
                    </a:User>
                </a:Users>

                    <a:Setting>UserDisplayName</a:Setting>
                    <a:Setting>UserDN</a:Setting>
                    <a:Setting>UserDeploymentId</a:Setting>
                    <a:Setting>InternalMailboxServer</a:Setting>
                    <a:Setting>MailboxDN</a:Setting>
                    <a:Setting>PublicFolderServer</a:Setting>
                    <a:Setting>ActiveDirectoryServer</a:Setting>

            </a:Request>
        </a: GetUserSettingsRequestMessage>
    </soap:Body>
</soap:Envelope>

```

The server then constructs the Autodiscover response XML and sends it to the client, as shown in the following example.

```

## 5 Security

### 5.1 Security Considerations for Implementers

Autodiscovery uses this protocol over Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS) (Hypertext Transfer Protocol (HTTP) with Secure Sockets Layer (SSL)). Not providing SSL will seriously affect the functionality of this protocol. The server will not answer Autodiscover queries unless the Autodiscover client has first authenticated with the Autodiscover server.

The **GetFederationInformation** (section [3.1.4.2](#)) operation should be anonymous. The intent of **GetFederationInformation** is to provide information to other organizations with the security token service (STS) in common, instructing them on how to request tokens to authenticate against other services. Therefore, the caller needs to have access to the federation information without the need to authenticate first.

### 5.2 Index of Security Parameters

None.

## 6 Appendix A: Full WSDL

The Autodiscover service contains a WSDL and an XSD file (messages.xsd). These two **XML** files, which are listed and described in the following table, are required for implementing the functionality specified in this document. The entire contents of both of these files are included in this section.

File name	Description	Section
MS-OXWSADISC.wsdl	Contains the WSDL for the implementation of this protocol.	<a href="#">6.1</a>
MS-OXWSADISC-messages.xsd	Contains the XML schema message definitions that are used in this protocol.	<a href="#">6.2</a>

These files have to be placed in a common folder; otherwise, the WSDL won't validate and operate properly. Also, any schema files that are included in or imported into the MS-OXWSADISC-types.xsd or MS-OXWSADISC-messages.xsd schemas have to be placed in the same folder as these files.

### 6.1 WSDL

For a specification of the Web Service Description Language (WSDL), see [\[WSDL\]](#).

For ease of implementation, the full WSDL is included in this section.

## 7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products:

- Microsoft® Exchange Server 2010
- Microsoft® Exchange Server 2010 Service Pack 1 (SP1)

Exceptions, if any, are noted below. If a service pack number appears with the product version, behavior changed in that service pack. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that product does not follow the prescription.

## 8 Change Tracking

This section identifies changes that were made to the [MS-OXWSADISC] protocol document between the August 2010 and November 2010 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- An extensive rewrite, addition, or deletion of major portions of content.
- Changes made for template compliance.
- Removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the language and formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical or language changes were introduced. The technical content of the document is identical to the last released version, but minor editorial and formatting changes, as well as updates to the header and footer information, and to the revision summary, may have been made.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.

- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- New content added for template compliance.
- Content updated for template compliance.
- Content removed for template compliance.
- Obsolete document removed.

Editorial changes are always classified with the change type "Editorially updated."

Some important terms used in revision type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact [protocol@microsoft.com](mailto:protocol@microsoft.com).
