[MS-RAIW]: Remote Administrative Interface: WINS Specification

Intellectual Property Rights Notice for Open Specifications Documentation

- Technical Documentation. Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the Open Specifications.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft's Open Specification Promise (available here: http://www.microsoft.com/interop/osp) or the Community Promise (available here: http://www.microsoft.com/interop/cp/default.mspx). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights.
- Fictitious Names. The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

1 Introduction

This is a specification of the Remote Administrative Interface: WINS protocol. This protocol defines **remote procedure call (RPC)** interfaces that provide methods for remotely accessing and administering a server for the **Windows Internet Name Service (WINS)**. This protocol is a client/server protocol that is based on RPC and is used in the configuration, management, and monitoring of a **WINS server**.

An application implementing this protocol can remotely perform service monitoring of a WINS server as well as creating, updating, querying, or deleting database records, performing database **scavenging**, and **replicating** the database records with other WINS servers.

1.1 Glossary

The following terms are defined in [MS-GLOS]:

authentication level Authentication Service (AS) broadcast client (1) domain domain controller (DC) domain master browser server domain name Domain Name System (DNS) dvnamic endpoint endpoint globally unique identifier (GUID) Interface Definition Language (IDL) Internet Protocol version 4 (IPv4) Internet Protocol version 6 (IPv6) IPv4 address in string format little-endian Microsoft Interface Definition Language (MIDL) multicast named pipe NetBIOS **NetBIOS** name **NetBIOS Name Server (NBNS) NetBIOS suffix** Network Data Representation (NDR) opnum remote procedure call (RPC) replication **RPC** protocol sequence **RPC transfer syntax RPC transport** security provider **Transmission Control Protocol (TCP)** unicast Unicode Unicode string UTF-16LE (Unicode Transformation Format, 16-bits, little-endian)

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

universally unique identifier (UUID) well-known endpoint

The following terms are specific to this document:

- ACTIVE: The state of a name record, in which it has been registered but not released.
- active record: A name record that has been registered but not released.
- address version map: See owner version map.
- **attributes of a name record:** The name, type of record, IP Address, version number, node type, owner id, state, static type, and time stamp of a **name record**.
- **browser name:** A **NetBIOS name** whose 16th character is set to 0x1B. This name is used to identify the **domain master browser server** for a **domain**.
- dynamic record: A name record that was created through NetBT name registration by a client.
- extinction interval: The interval at which released names are changed to the tombstone state.
- **HostName:** The name of a host on a network. Users specify computers on a network by their host names.
- **multihomed:** Multiple network interfaces to multiple separate physical networks and thus multiple **IPv4** addresses.

multihomed machine name: The NetBIOS name of a machine that is multihomed.

name record: The NetBIOS name-to-IPv4 address mapping.

- **name server:** The server that resolves names for hosts by providing **NetBIOS name**-to-**IPv4** address mappings.
- NBNS partner: An NBNS replication partner.
- NBNS pull partner: A NetBIOS name server that requests new NBNS name records (replicas) from its partner.
- NBNS push partner: An NBNS server that pushes or notifies NBNS servers that are configured as pull partners of the need to replicate their name records.
- **NBNS replication partner:** An **NBNS server** that is configured or discovered as a partner to exchange the **NBNS** database.
- **NetBIOS scope:** The population of computers across which a registered **NetBIOS name** is known. Each NetBIOS scope has a scope identifier, which is a character string that meets the requirements of the **Domain Name System (DNS)** for **domain names**.

NetBT: NetBIOS over TCP/IP.

- **NetBT b-node:** A **NetBT node type** that is configured to use **broadcast NetBIOS name** queries for name registration and resolution.
- **NetBT h-node:** A combination of **NetBT b-node** and **p-node** functionality. An h-node uses point-to-point communication first. If the **NBNS** cannot be located, h-node switches to

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

broadcast. The h-node continues to poll for the name server and returns to point-to-point communication when one becomes available.

- **NetBT m-node:** A **NetBT node type** that uses a mix of **b-node** and **p-node** communications to register and resolve **NetBIOS names**. An m-node uses **broadcast** resolution first; then, if necessary, it uses a server query.
- NetBT name resolution: The process of resolving a NetBIOS name to an IPv4 address.
- NetBT node type: The transport mechanism used to resolve NetBIOS names that are broadcast, multicast, or unicast.
- **NetBT p-node:** A **NetBT node type** that does not use **broadcasts** for name registration or **name_resolution**. Instead, all systems register themselves with an **NBNS** upon startup. The **NBNS** is responsible for mapping computer names to **IPv4** addresses and making sure that no duplicate names are registered on the network.
- **normal group:** A group of hosts that does not have an associated address. It is assumed to be valid on any subnet.
- owner NBNS server: An NBNS server that handles the name registration of a client and so owns the mapping for that client. An owner NBNS server is also referred to by the term owner WINS server in this document.
- **owner version map:** A table in which each entry has two fields, owner and version number. The owner field contains a **WINS server** address; the version number field contains the highest version number of all the records owned by the **owner WINS server** that are stored at the local **WINS server**.

owner WINS server: See owner NBNS server.

partner: See NBNS partner

point-to-point node: See NetBT p-node.

priority class: An attribute of a process that is used to determine the scheduling priority of threads of that process. The priority of a thread is determined by a combination of the **priority class** of its process and the priority level of the thread within the **priority class**.

pull partner: See NBNS pull partner

- **RELEASED:** The state of a **name record**, in which its name has been explicitly released through a name release request, or in which it has failed to be refreshed by name by a **client** within the renewal interval.
- **released record:** A **name record** that has been explicitly released through a name release request; or a **name record** that a **client** has failed to refresh by name within the renewal interval.

replica: NBNS database name records (name-to-IPv4 address mapping) replicated from other NBNS servers.

replication partner: See NBNS replication partner

scavenging: The process in which the state of database records is changed if the current time exceeds the record's time stamp value. For example, an active record becomes a released record when the current time exceeds the time stamp associated with that record.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

special group: A group of hosts that have a single name. When a name registration is received for a special group, the actual address rather than the limited **broadcast** address is stored in the group. When a name query is received for such a group, the **IPv4** addresses that have not timed out are returned.

static record: A manually created entry in the database of a NBNS server.

target WINS server: The WINS server on which the RPC method call is being executed.

time to live (TTL): The amount of time that a NetBIOS name is stored on an NBNS server.

tombstone interval: See extinction interval.

tombstone state, tombstoned: The state of a **released record** that is not re-registered or refreshed by a **client** within the **extinction interval**.

Windows Internet Name Service (WINS): The Microsoft implementation of an NBNS server.

WINS server: A server that hosts a Microsoft implementation of an **NBNS server**.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.3 Overview

The Remote Administrative Interface: WINS protocol is a client/server protocol that is used to remotely configure, manage, and monitor the WINS server. This protocol allows a **client** to view and update the server configuration settings as well as to create, modify, and delete WINS database records. It also allows clients to trigger scavenging and replicating operations and to query the database.

The Remote Administrative Interface: WINS protocol is stateless with no state shared across RPC method calls. Each RPC method call contains one complete request. Output from one method call can be used as an input to another call, but the protocol does not provide methods for locking the WINS server configuration or state data across method calls. For example, a client can pull a range of records from the database and delete some of them using another RPC call. However, the protocol does not guarantee that the specified record has not been modified by another client between the two method calls.

Remote Administrative Interface: WINS	
Remote Procedure Call (RPC)	
ТСР	Named Pipes

Figure 1: Relationship of Remote Administrative Interface: WINS to RPC

1.4 Relationship to Other Protocols

The Remote Administrative Interface: WINS protocol relies on RPC [MS-RPCE] as a transport. It is used to manage the WINS service on servers that implement the Windows Internet Naming Service (WINS) Replication and Autodiscovery Protocol [MS-WINSRA].

1.5 Prerequisites/Preconditions

The Remote Administrative Interface: WINS protocol is implemented on top of RPC and, as a result, has the prerequisites identified in <u>[MS-RPCE]</u>.

The Remote Administrative Interface: WINS protocol assumes that before this protocol is invoked, a client has obtained the name or the IP address of the WINS server that implements this protocol suite.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

1.6 Applicability Statement

The Remote Administrative Interface: WINS protocol is applicable when an application needs to remotely configure, manage, or monitor a WINS server.

Because the **NetBIOS** protocol [RFC1002] does not support the mapping between **NetBIOS names** and **IPv6** addresses, the Remote Administrative Interface: WINS protocol applies only to **IPv4** addresses. It does not apply to IPv6 addresses.

1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following areas:

- **Supported Transports**: The Remote Administrative Interface: WINS protocol uses the RPC protocol as a transport and <u>RPC Protocol Sequences</u> as specified in section <u>2.1</u>.
- Protocol Versions: This protocol has only one interface version, but that interface has been
 extended by adding additional methods at the end. The use of these methods is specified in
 section <u>3.1</u>.
- Security and Authentication Methods: Authentication and security for the methods specified by this protocol are specified in [MS-RPCE] and in section 2.1.
- Localization: This protocol passes text strings in various methods. Localization considerations
 for such strings are specified in sections <u>2.2</u> and <u>3.1.4</u>.
- **Capability Negotiation**: The Remote Administrative Interface: WINS protocol does not support interface version negotiation. Instead, this protocol uses the interface version number specified in the **interface definition language (IDL)** for versioning and capability negotiation.

1.8 Vendor-Extensible Fields

The Remote Administrative Interface: WINS protocol uses Win32 error codes as defined in [MS-ERREF] (section 2.2). Vendors SHOULD reuse those values with their indicated meanings. Choosing any other value runs the risk of a collision in the future.

1.9 Standards Assignments

Remote Administrative Interface: WINS protocol uses the following private assignments.

Parameter	Value	Reference
RPC interface universally unique identifier (UUID)	45f52c28-7f9f-101a-b52b- 08002b2efabe	[C706] section A.2.5 winsif interface (section 3.1)
RPC interface UUID	811109bf-a4e1-11d1-ab54- 00a0c91e9b45	[C706] section A.2.5 winsi2 interface (section 3.2)
Named pipe	"\pipe\WinsPipe"	Transport (section 2.1)

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

2 Messages

2.1 Transport

For the Remote Administrative Interface: WINS protocol, the WINS server MUST support the following RPC transports:

- RPC over **TCP**, with port selection performed dynamically by RPC.
- RPC over named pipes, with the endpoint name "\pipe\WinsPipe".

2.1.1 Server Security Settings

The Remote Administrative Interface: WINS protocol uses **security support provider (SSP)** security provided by RPC as specified in [MS-RPCE]. The WINS RPC server uses the principal name "Wins" and the authentication service RPC_C_AUTHN_WINNT.

The WINS server MUST allow only authenticated access to RPC clients. The WINS server MUST NOT allow anonymous or unauthenticated RPC clients to connect. The WINS server MUST perform authorization checks to ensure that the client is authorized to perform a specific RPC operation.

The following mechanisms are enforced for client authorization:

- The WINSRA client SHOULD be a member of the WINS Users or WINS Administrator security group in order to retrieve information from the WINS server. This level of authorization is termed "query-level access".<1>
- The WINSRA client MUST be a member of the WINS Administrator security group before it can retrieve or modify information on the WINS server. This level of authorization is termed "control-level access".

Control-level access also includes query-level access. Therefore, clients with control access can also call methods that require only query-level access. The WINS server MUST limit access to only those clients that negotiate an authentication level equal to or higher than RPC_C_AUTHN_LEVEL_CONNECT.

2.1.2 Client Security Settings

The RPC client SHOULD use security support provider (SSP) security provided by RPC as specified in [MS-RPCE]. The clients SHOULD use the server principal name "Wins", authentication service RPC_C_AUTHN_WINNT, and authentication level RPC_C_AUTHN_LEVEL_CONNECT while creating the binding handle.

2.2 Common Data Types

In addition to the RPC base types and definitions specified in [C706] and [MS-RPCE], additional data types are defined in this section. The following statements apply to those data types unless indicated otherwise:

- All multiple byte numeric values in messages use **little-endian** byte order.
- All character strings are encoded in Unicode UTF-16LE.

2.2.1 Datatypes, Enumerations, and Constants

2.2.1.1 WINSIF_HANDLE

The **WINSIF_HANDLE** data type is defined as a pointer to the <u>WINSINTF_BIND_DATA_T</u> structure. It is used by the RPC methods <u>R_WinsGetBrowserNames</u> and <u>R_WinsStatusWHdl</u>.

This type is declared as follows:

typedef [handle] PWINSINTF BIND DATA T WINSIF HANDLE;

2.2.1.2 WINSINTF_VERS_NO_T

The **WINSINTF_VERS_NO_T** data type indicates the version number of a WINS database record. It is used by several RPC methods like **<u>R</u>** <u>WinsGetDbRecs</u> and <u>**R**</u> <u>WinsDelDbRecs</u>.

This type is declared as follows:

typedef LARGE INTEGER WINSINTF VERS NO T;

2.2.1.3 WINSINTF_MAX_NO_RPL_PNRS

The **WINSINTF_MAX_NO_RPL_PNRS** constant defines the maximum number of **pull replication partners**. It is used by the structure **WINSINTF_RESULTS_T (section 2.2.2.7)**.

Constant/value	Description
WINSINTF_MAX_NO_RPL_PNRS 25	The maximum number of pull replication partners.

2.2.1.4 WINSINTF_ACT_E

The **WINSINTF_ACT_E** enumeration indicates an action type requested by the RPC method <u>R WinsRecordAction</u> for a record contained in the <u>WINSINTF_RECORD_ACTION_T</u> structure.

```
typedef enum _WINSINTF_ACT_E
{
  WINSINTF_E_INSERT = 0,
  WINSINTF_E_DELETE,
  WINSINTF_E_RELEASE,
  WINSINTF_E_MODIFY,
  WINSINTF_E_QUERY
} WINSINTF_ACT_E,
 *PWINSINTF_ACT_E;
```

WINSINTF_E_INSERT: Insert a record into the WINS database.

WINSINTF_E_DELETE: Delete a matching record from the WINS database.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

WINSINTF_E_RELEASE: Release a matching record from the WINS database.

WINSINTF_E_MODIFY: Modify the attributes of the matching record.

WINSINTF_E_QUERY: Query the database for a given name.

2.2.1.5 WINSINTF_CMD_E

The **WINSINTF_CMD_E** enumeration is used by the RPC methods to retrieve the configuration of a particular WINS server. This enumeration is used in conjunction with the <u>WINSINTF_RESULTS_T</u> and <u>WINSINTF_RESULTS_NEW_T</u> structures.

```
typedef enum _WINSINTF_CMD_E
{
   WINSINTF_E_ADDVERSMAP = 0,
   WINSINTF_E_CONFIG,
   WINSINTF_E_STAT,
   WINSINTF_E_CONFIG_ALL_MAPS
} WINSINTF_CMD_E,
 *PWINSINTF_CMD_E;
```

WINSINTF_E_ADDVERSMAP: Gets an entry from the **owner version map** of the **target WINS server**.

WINSINTF_E_CONFIG: Get the configuration details of the target WINS server.

WINSINTF_E_STAT: Get statistics for the target WINS server.

WINSINTF_E_CONFIG_ALL_MAPS: Get all owner version map entries from the target WINS server.

2.2.1.6 WINSINTF_TRIG_TYPE_E

The **WINSINTF_TRIG_TYPE_E** enumeration defines the type of replication to be done. It is used by the RPC method <u>R WinsTrigger</u>.

```
typedef enum _WINSINTF_TRIG_TYPE_E
{
  WINSINTF_E_PULL = 0,
  WINSINTF_E_PUSH,
  WINSINTF_E_PUSH_PROP
} WINSINTF_TRIG_TYPE_E,
 *PWINSINTF_TRIG_TYPE_E;
```

WINSINTF_E_PULL: The target WINS server performs pull replication with the specified WINS server.

WINSINTF_E_PUSH: The target WINS server performs push replication with the specified WINS server.

WINSINTF_E_PUSH_PROP: The target WINS server performs propagating push replication with the specified WINS server.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

2.2.1.7 WINSINTF_PRIORITY_CLASS_E

The **WINSINTF_PRIORITY_CLASS_E** enumeration defines the **priority class** of a WINS process. It is used by the RPC method **R** <u>WinsSetPriorityClass</u>.

```
typedef enum _WINSINTF_PRIORITY_CLASS_E
{
  WINSINTF_E_NORMAL = 0,
  WINSINTF_E_HIGH
} WINSINTF_PRIORITY_CLASS_E,
 *PWINSINTF PRIORITY_CLASS_E;
```

WINSINTF_E_NORMAL: WINS process is assigned normal priority class.

WINSINTF_E_HIGH: WINS process is assigned high priority class.

2.2.1.8 WINSINTF_SCV_OPC_E

The **WINSINTF_SCV_OPC_E** enumeration specifies the type of scavenging to be done on the target WINS server. This enumeration is used in the structure <u>WINSINTF_SCV_REQ_T</u>.

```
typedef enum _WINSINTF_SCV_OPC_E
{
  WINSINTF_E_SCV_GENERAL = 0,
  WINSINTF_E_SCV_VERIFY
} WINSINTF_SCV_OPC_E,
 *PWINSINTF_SCV_OPC_E;
```

WINSINTF_E_SCV_GENERAL: Requests normal scavenging operation.

WINSINTF_E_SCV_VERIFY: Verifies only the replicated active records with their owner NBNS servers for their validity.

2.2.2 Structures

2.2.2.1 WINSINTF_ADD_T

The **WINSINTF_ADD_T** structure defines the IP address information of a WINS server. It is used by several data structures including <u>WINSINTF_RECORD_ACTION_T</u> and <u>WINSINTF_ADD_VERS_MAP_T</u> and by RPC methods like <u>R_WinsTrigger</u> and <u>R_WinsGetDbRecs</u>.

```
typedef struct _WINSINTF_ADD_T {
  BYTE Type;
  DWORD Len;
  DWORD IPAdd;
} WINSINTF_ADD_T,
 *PWINSINTF ADD T;
```

Type: Specifies the address type. This field MUST be set to zero.

Len: Indicates the length, in bytes, of the IP address that is stored in IPAdd.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

IPAdd: Stores an IP address in little-endian format. For example, the IP address 172.22.32.42 is stored as 0xAC16202A.

2.2.2.2 WINSINTF_BIND_DATA_T

The **WINSINTF_BIND_DATA_T** structure defines the binding information of the WINS server to which the client connects.

```
typedef struct _WINSINTF_BIND_DATA_T {
  DWORD fTcpIp;
  [string] LPSTR pServerAdd;
  [string] LPSTR pPipeName;
} WINSINTF_BIND_DATA_T,
 *PWINSINTF_BIND_DATA_T;
```

fTcpIp: The transport mechanism to be used. If this value is 0x00000001, then TCP/IP is selected; otherwise, the named pipe is selected.

pServerAdd: A null-terminated string that specifies the server IP address.

pPipeName: A null-terminated string that specifies the pipe name. This value MUST be NULL when *fTcpIP* is 0x00000001.

2.2.2.3 WINSINTF_RECORD_ACTION_T

The **WINSINTF_RECORD_ACTION_T** structure defines a WINS database record and the action to be performed on it. The structure <u>WINSINTF_RECS_T (section 2.2.2.8)</u> and the RPC method <u>R_WinsRecordAction (section 3.1.4.1)</u> both use this structure.

```
typedef struct WINSINTF RECORD ACTION T {
 WINSINTF ACT E Cmd e;
 [size is(NameLen + 1)] LPSTR pName;
 DWORD NameLen;
 DWORD TypOfRec e;
 DWORD NoOfAdds;
  [unique, size is(NoOfAdds)] PWINSINTF ADD T pAdd;
 WINSINTF ADD T Add;
 LARGE INTEGER VersNo;
 BYTE NodeTyp;
 DWORD OwnerId;
 DWORD State e;
 DWORD fStatic;
 DWORD PTR TimeStamp;
} WINSINTF RECORD ACTION T,
*PWINSINTF RECORD ACTION T;
```

Cmd_e: A <u>WINSINTF ACT E</u> enumeration (section <u>2.2.1.4</u>) value that specifies the action to be performed on the specified record.

pName: A pointer to a null-terminated string that contains the NetBIOS name and optionally the **NetBIOS scope** name of the record. The NetBIOS scope name, if present, is appended to the NetBIOS name with a dot character ".".

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

If the NetBIOS name contains fewer than 16 characters, space characters MUST be used to pad the name string up to the **NetBIOS suffix**, which occupies the 16th character position.

NameLen: The length of the string that *pName* points to. It has the following possible values:

Value	Meaning	
16	The pName value points to a string that contains only the NetBIOS name of the record. The NameLen value does not include the terminating null character.	
18 < value	The pName value points to a string that contains the NetBIOS name, a dot character ".", and the null-terminated NetBIOS scope name of the record. The NameLen value includes the terminating null character.	
	If the NameLen value is greater than 255, the pName string SHOULD be truncated to 254 characters plus a terminating null character.	

TypOfRec_e: The record type. Only the two least-significant bits of the member value are considered valid. All other bits are masked with zero. The following values are allowed.

Value	Meaning
0	Unique name
1	Normal group name
2	Special group name
3	Multihomed machine name

- **NoOfAdds:** The number of IP addresses that are mapped to the NetBIOS name given in *pName*. It SHOULD have the value zero for unique names and **normal groups**, and it SHOULD have a value greater than 0x00000001 for other types of records.
- **pAdd:** A pointer to an array of IP addresses that are mapped to the name given in *pName*. It MUST be used only for multihomed and **special group** types of records.
- **Add:** The IP address mapped to the name given in *pName*. This member MUST be used only for unique and normal group types of records.
- **VersNo:** The version number of the record.
- **NodeTyp:** The **NetBT node type**. Only the two least-significant bits of the member value are considered valid. All other bits are masked with zero. This member MUST have one of the following values:

Value	Meaning
0	B-node
1	P-node
2	M-node
3	H-node

OwnerId: The owner IP address of the record, in little-endian byte order.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

State_e: The state of the record. Only the two least-significant bits of the member value are considered valid. All other bits are masked with zero. This member MUST have one of the following values:

Value	Meaning
0	Active record
1	Released record
2	Tombstoned record
3	Deleted record

fStatic: A value that indicates whether the record is **static** or **dynamic**. A value of 0 indicates a dynamic record, and 1 indicates a static record. Only the least-significant bit is considered valid. All other bits are masked with zero.

TimeStamp: The time stamp [ISO-8601] of the record.

2.2.2.4 WINSINTF_ADD_VERS_MAP_T

The **WINSINTF_ADD_VERS_MAP_T** structure defines an **address version map** pair. This data structure is generally used by other data structures, such as <u>WINSINTF_RESULTS_T</u> and <u>WINSINTF_RESULTS_NEW_T</u>.

```
typedef struct _WINSINTF_ADD_VERS_MAP_T {
  WINSINTF_ADD_T Add;
  LARGE_INTEGER VersNo;
} WINSINTF_ADD_VERS_MAP_T,
 *PWINSINTF ADD VERS MAP T;
```

Add: A structure containing the IP address of a partner WINS server.

VersNo: The highest version number from all of the records owned by a WINS server at the target WINS server database. Each record in the database has a version number and owner Id associated with it.

2.2.2.5 WINSINTF_RPL_COUNTERS_T

The **WINSINTF_RPL_COUNTERS_T** structure defines counters that contain the number of successful pull replications and the number of communication failures for a given **replication partner**. It is used in the structure <u>WINSINTF_STAT_T</u>.

```
typedef struct _WINSINTF_RPL_COUNTERS_T {
  WINSINTF_ADD_T Add;
  DWORD NoOfRpls;
  DWORD NoOfCommFails;
} WINSINTF_RPL_COUNTERS_T,
 *PWINSINTF_RPL_COUNTERS_T;
```

Add: The IP address of a partner WINS server.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

NoOfRpls: The number of successful pull replications that have been performed with the replication partner. The target WINS server stores the replication partner's IP address in the *Add* member.

NoOfCommFails: The number of communication failures that have occurred in pull replications between the WINS server whose IP address is given in *Add* and the target WINS server.

2.2.2.6 WINSINTF_STAT_T

The **WINSINTF_STAT_T** structure defines counters, configured timestamps, the pull replication statistics for a given WINS server. This structure is used by the structure <u>WINSINTF RESULTS T</u> (section 2.2.2.7).

```
typedef struct WINSINTF STAT T {
 struct {
   DWORD NoOfUniqueReg;
   DWORD NoOfGroupReg;
   DWORD NoOfQueries;
    DWORD NoOfSuccQueries;
    DWORD NoOfFailQueries;
    DWORD NoOfUniqueRef;
    DWORD NoOfGroupRef;
    DWORD NoOfRel;
   DWORD NoOfSuccRel;
   DWORD NoOfFailRel;
   DWORD NoOfUniqueCnf;
   DWORD NoOfGroupCnf;
 } Counters;
 struct {
    SYSTEMTIME WINSStartTime;
    SYSTEMTIME LastPScvTime;
    SYSTEMTIME LastATScvTime;
    SYSTEMTIME LastTombScvTime;
   SYSTEMTIME LastVerifyScvTime;
   SYSTEMTIME LastPRplTime;
   SYSTEMTIME LastATRplTime;
    SYSTEMTIME LastNTRplTime;
   SYSTEMTIME LastACTRplTime;
   SYSTEMTIME LastInitDbTime;
   SYSTEMTIME CounterResetTime;
  } TimeStamps;
 DWORD NoOfPnrs;
 [unique, size is(NoOfPnrs)] PWINSINTF RPL COUNTERS T pRplPnrs;
} WINSINTF STAT T,
*PWINSINTF STAT T;
```

Counters: A structure that contains 32-bit unsigned integer counters, which measure various statistics on a WINS server.

- **NoOfUniqueReg:** The number of unique registrations on the target WINS server since the service was started.
- **NoOfGroupReg:** The number of group registrations at the target WINS server since the service was started.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

- **NoOfQueries:** The number of queries that clients have performed on the target WINS server to resolve NetBIOS names since the service was started. This value is the sum of the values maintained in *NoOfSuccQueries* and *NoOfFailQueries*.
- **NoOfSuccQueries:** The number of successful **name_resolution** queries on the target WINS server since the service was started.
- **NoOfFailQueries:** The number of failed name_resolution queries on the target WINS server since the service was started.
- **NoOfUniqueRef:** The number of unique name refreshes on the target WINS server since the service was started.
- **NoOfGroupRef:** The number of group name refreshes on the target WINS server since the service was started.
- **NoOfRel:** The number of name releases on the target WINS server since the service was started. This value is the sum of the values maintained in *NoOfSuccRel* and *NoOfFailRel*.
- **NoOfSuccRel:** The number of successful name releases on the target WINS server since the service was started.
- **NoOfFailRel:** The number of failed name releases on the target WINS server since the service was started.
- **NoOfUniqueCnf:** The number of unique name conflicts on the target WINS server since the service was started. Unique name conflicts can occur in the following cases:
 - The server is registering or refreshing unique name requests from clients.
 - The server is replicating unique name records from a partner WINS server.
- **NoOfGroupCnf:** The number of group name conflicts on the target WINS server since the service was started. Group name conflicts can occur in the following cases:
 - The server is registering or refreshing unique name requests from clients.
 - The server is replicating unique name records from a partner WINS server.

TimeStamps: A structure that contains data in <u>SYSTEMTIME</u> structures (<u>[MS-DTYP]</u> section 2.3.11), which reflect the local time zone of the target WINS server.

- **WINSStartTime:** The time at which the WINS service was started on the target WINS server.
- **LastPScvTime:** The time at which the last periodic scavenging operation was done on the target WINS server.
- **LastATScvTime:** The time at which the last administrator-triggered scavenging operation was done on the target WINS server.
- **LastTombScvTime:** The time at which the last scavenging operation was done for the replicated tombstone records on the target WINS server.
- **LastVerifyScvTime:** The time at which the last verification scavenging operation was done for the replicated active records on the target WINS server.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

- **LastPRpITime:** The time at which the last periodic pull replication was done on the target WINS server.
- **LastATRpITime:** The time at which the last administrator-triggered pull replication was done on the target WINS server.
- LastNTRpITime: This member is not set and MUST be ignored on receipt.
- LastACTRpITime: This member is not set and MUST be ignored on receipt.
- **LastInitDbTime:** The time at which the last static database initialization was done on the target WINS server.
- **CounterResetTime:** The last time at which the administrator has cleared the success and failure replication counters of the target WINS server.

NoOfPnrs: The number of pull partners configured for the target WINS server.

pRpIPnrs: A pointer to structures that contain the details of successful and failed replication counters of configured pull partners at the target WINS server, since the time service was started; or, the time at which the last reset happened by a call to the method <u>R WinsResetCounters (section 3.1.4.12)</u>. The number of structures is specified by NoOfPnrs.

2.2.2.7 WINSINTF_RESULTS_T

The **WINSINTF_RESULTS_T** structure defines information related to the configuration and statistics of a target WINS server. This is used by RPC method <u>**R**</u> <u>WinsStatus</u>.

```
typedef struct _WINSINTF_RESULTS_T {
   DWORD NoOfOwners;
   WINSINTF_ADD_VERS_MAP_T AddVersMaps[WINSINTF_MAX_NO_RPL_PNRS];
   LARGE_INTEGER MyMaxVersNo;
   DWORD RefreshInterval;
   DWORD TombstoneInterval;
   DWORD TombstoneTimeout;
   DWORD VerifyInterval;
   DWORD WINSPriorityClass;
   DWORD NoOfWorkerThds;
   WINSINTF_STAT_T WINSStat;
} WINSINTF_RESULTS_T,
 *PWINSINTF RESULTS_T;
```

NoOfOwners: The number of owners whose records are part of the target WINS server database. The value of this member MUST be less than or equal to 25.

AddVersMaps: A structure containing the owner version map of the target WINS server. The number of valid entries is defined by the *NoOfOwners* value.

MyMaxVersNo: This member is not set and MUST be ignored on receipt.

RefreshInterval: The refresh time interval configured on the target WINS server, in seconds.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

TombstoneInterval: The **tombstone time interval** configured on the target WINS server, in seconds.

TombstoneTimeout: The tombstone timeout configured on the target WINS server, in seconds.

VerifyInterval: The verify time interval configured on the target WINS server, in seconds.

WINSPriorityClass: The priority class of the WINS process running on the target WINS server. It SHOULD have one of the following values: $\leq 2 \geq$

Value	Meaning
NORMAL_PRIORITY_CLASS 0x00000020	The process has no special scheduling requirements.
HIGH_PRIORITY_CLASS 0x00000080	The process performs time-critical tasks that MUST be executed immediately for the process to run correctly. The threads of a high- priority class process preempt the threads of normal-priority class processes.

- **NoOfWorkerThds:** The number of threads created in the WINS process for serving the NetBIOS name requests.
- **WINSStat:** A <u>WINSINTF STAT T</u> structure (section <u>2.2.2.6</u>) containing timing parameters configured on the target WINS server and the pull replication statistics of partner WINS servers.

2.2.2.8 WINSINTF_RECS_T

The structure **WINSINTF_RECS_T** defines an array of <u>WINSINTF_RECORD_ACTION_T</u> (section 2.2.2.3) elements. The <u>R_WinsGetDbRecs (section 3.1.4.6)</u> and <u>R_WinsGetDbRecsByName (section 3.1.4.19)</u> methods use this structure.

```
typedef struct _WINSINTF_RECS_T {
   DWORD BuffSize;
   [unique, size_is(NoOfRecs)] PWINSINTF_RECORD_ACTION_T pRow;
   DWORD NoOfRecs;
   DWORD TotalNoOfRecs;
} WINSINTF_RECS_T,
 *PWINSINTF_RECS_T;
```

BuffSize: The number of bytes allocated for the pointer *pRow*.

pRow: A pointer to an array of **WINSINTF_RECORD_ACTION_T** elements.

NoOfRecs: The number of records stored in the array pointed to by *pRow*.

TotalNoOfRecs: This member is not set and MUST be ignored on receipt.

2.2.2.9 WINSINTF_BROWSER_INFO_T

The **WINSINTF_BROWSER_INFO_T** structure defines information about browser names. It is used by the structure **WINSINTF BROWSER NAMES T**.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

```
typedef struct _WINSINTF_BROWSER_INFO_T {
  DWORD dwNameLen;
  [string] LPBYTE pName;
} WINSINTF_BROWSER_INFO_T,
 *PWINSINTF BROWSER INFO T;
```

dwNameLen: The length of the name that **pName** points to, in bytes. This length includes the terminating null character.

pName: A pointer to a null-terminated string that contains the **browser name**.

2.2.2.10 WINSINTF_BROWSER_NAMES_T

The **WINSINTF_BROWSER_NAMES_T** structure defines an array of browser names. This structure is used by the RPC method **R** <u>WinsGetBrowserNames</u>.

```
typedef struct _WINSINTF_BROWSER_NAMES_T {
   DWORD EntriesRead;
   [unique, size_is(EntriesRead)] PWINSINTF_BROWSER_INFO_T pInfo;
} WINSINTF_BROWSER_NAMES_T,
 *PWINSINTF_BROWSER_NAMES_T;
```

EntriesRead: The number of entries in the array that pInfo points to.

pInfo: A pointer to an array of browser names. EntriesRead contains the length of this array.

2.2.2.11 WINSINTF_RESULTS_NEW_T

The **WINSINTF_RESULTS_NEW_T** structure defines configuration information and statistics for a target WINS server. This structure is used by the RPC method <u>R_WinsStatusNew (section</u> <u>3.1.4.20</u>).

```
typedef struct _WINSINTF_RESULTS_NEW_T {
  DWORD NoOfOwners;
  [unique, size_is(NoOfOwners)] PWINSINTF_ADD_VERS_MAP_T pAddVersMaps;
  LARGE_INTEGER MyMaxVersNo;
  DWORD RefreshInterval;
  DWORD TombstoneInterval;
  DWORD TombstoneTimeout;
  DWORD VerifyInterval;
  DWORD WINSPriorityClass;
  DWORD NoOfWorkerThds;
  WINSINTF_STAT_T WINSStat;
} WINSINTF_RESULTS_NEW_T,
 *PWINSINTF RESULTS_NEW_T;
```

NoOfOwners: The number of owners whose records are part of the target WINS server database.

pAddVersMaps: A pointer to an array of <u>WINSINTF_ADD_VERS_MAP_T</u> structure (section <u>2.2.2.4</u>) elements. The **NoOfOwners** member contains the number of elements in the array.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

MyMaxVersNo: This member is not set and MUST be ignored on receipt.

RefreshInterval: The refresh time interval configured on the target WINS server, in seconds.

TombstoneInterval: The tombstone time interval configured on the target WINS server, in seconds.

TombstoneTimeout: The tombstone timeout configured on the target WINS server, in seconds.

VerifyInterval: The verify time interval configured on the target WINS server, in seconds.

WINSPriorityClass: The priority class of the WINS process running on the target WINS server. It can have one of the following values:

Value	Meaning
NORMAL_PRIORITY_CLASS 0x00000020	The process has no special scheduling requirements.
HIGH_PRIORITY_CLASS 0x00000080	The process performs time-critical tasks that MUST be executed immediately for the process to run correctly. The threads of a high- priority class process preempt the threads of normal-priority class processes.

NoOfWorkerThds: The number of threads created in the WINS process to serve NetBIOS name requests.

WINSStat: A <u>WINSINTE STAT T</u> structure (section <u>2.2.2.6</u>) containing timing parameters configured on the target WINS server and pull replication statistics of partner WINS servers.

2.2.2.12 WINSINTF_SCV_REQ_T

The **WINSINTF_SCV_REQ_T** structure defines the type of scavenging that needs to be done on the target WINS server. This is used by the RPC method <u>**R_WinsDoScavengingNew (section</u>** <u>**3.1.4.22**</u>).</u>

```
typedef struct _WINSINTF_SCV_REQ_T {
  WINSINTF_SCV_OPC_E Opcode_e;
  DWORD Age;
  DWORD fForce;
} WINSINTF_SCV_REQ_T,
 *PWINSINTF_SCV_REQ_T;
```

Opcode_e: A <u>WINSINTF SCV OPC E</u> enumeration (section <u>2.2.1.8</u>) value describing the type of scavenging operation to be performed on the target WINS server.

Age: This member is not set and MUST be ignored on receipt.

fForce: Specifies whether a forceful scavenging is required.

Value	Meaning
0x0000000	The internal state and configuration of the WINS server determine whether scavenging is performed.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

Value	Meaning
0x00000001 — 0xFFFFFFF	The target WINS server performs scavenging.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

3 Protocol Details

The client side of The Remote Administrative Interface: WINS protocol is simply a pass-through. This means that no additional timers or state are required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

The WINS server supports two interfaces:

- 1. winsif (section 3.1.4)
- 2. winsi2 (section 3.2.4)

To support both interfaces, client applications are responsible for implementing mechanisms to manage memory such as the following:

- midl_user_allocate: Allocates memory for RPC input and output parameters.
- midl_user_free: Frees memory used by RPC input and output parameters.

Clients SHOULD call **midl_user_allocate** to allocate memory for any input pointer arguments to the RPC methods. The client RPC stub MUST send the input data to the server and then SHOULD free that memory by calling **midl_user_free**. Similarly, when the client RPC stub receives a response from server, it SHOULD call **midl_user_allocate** to allocate memory for all output pointer arguments. Client applications SHOULD free this memory by calling **midl_user_free**.

3.1 winsif Server Details

The methods supported by the **winsif** interface are specified in <u>Message Processing Events and</u> <u>Sequencing Rules (section 3.1.4)</u>.

3.1.1 Abstract Data Model

This section describes a conceptual model that an implementation can maintain to participate in this protocol. The described organization is provided to facilitate the explanation of protocol behavior. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

A **NetBIOS name server (NBNS)** maintains the following data structures:

Name record: A data structure that contains a name and the associated attributes.

Name records collection: A collection of all **name records** that are either registered by this NBNS server or obtained by replication.

Owner version map: A map between each NBNS owner and the record from that owner with the highest version number in the name records collection. This map determines whether the NBNS server pulls records from its **partners** and, if so, the range of records it obtains.

Global version counter: A 64-bit unsigned integer that tracks the version number given to the next record that is updated.

Server configuration: Parameters maintained in persistent storage include the following:

Refresh interval

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

Extinction interval

- Extinction timeout
- Verify interval
- Process priority class
- Number of worker threads

Browser name cache: A list of browser names that are stored in the target WINS server. When the WINS service is initialized, the cache SHOULD be empty.

The **Browser name cache** SHOULD be populated when the **R_WinsGetBrowserNames** method (section <u>3.1.4.18</u>) is called for the first time, and every subsequent call to that method SHOULD return the contents of the cache. If 3 minutes or more has elapsed from the time the **Browser name cache** is refreshed, the WINS service SHOULD get the name records from the target WINS server database and update the cache.

3.1.2 Timers

No timers are required beyond those used internally by RPC to implement resiliency to network outages, as specified in [MS-RPCE] section 3.2.3.2.1.

3.1.3 Initialization

The **winsif** server for the Remote Administrative Interface: WINS MUST be initialized by registering the RPC interface and listening on the dynamically allocated port assigned by RPC, as specified in section 2.1. The client MUST contact the well-known RPC port on the WINS server to find the endpoint of **winsif**.

3.1.4 Message Processing Events and Sequencing Rules

The **winsif** interface provides methods that remotely configure, manage and monitor the WINS server.

Method	Description
<u>R WinsRecordAction</u>	Inserts, modifies, deletes, releases or queries a Name Record from the WINS database. Opnum: 0
<u>R_WinsStatus</u>	Retrieves various counters, configuration settings and the statistics of a WINS server. Opnum: 1
<u>R WinsTrigger</u>	Queues a request to trigger a replication from target WINS server to a specified WINS server. Opnum: 2
R_WinsDoStaticInit	Imports Name Records from a file to the WINS database. Opnum: 3

Methods in RPC Opnum Order

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

Method	Description
R WinsDoScavenging	Queues a Scavenging request at the target WINS server. Opnum: 4
<u>R WinsGetDbRecs</u>	Retrieves Name Records lying in a range of two version numbers and are owned by a particular WINS server. Opnum: 5
<u>R WinsTerm</u>	Sends a termination signal to the WINS process running on the target WINS server. Opnum: 6
<u>R_WinsBackup</u>	Backs up the WINS database to a specified directory. Opnum: 7
<u>R_WinsDelDbRecs</u>	Deletes Name Records lying in a range of two version numbers and are owned by a particular WINS server. Opnum: 8
<u>R WinsPullRange</u>	Pulls a range of records owned by a particular WINS server from another WINS server and replicates them with the target WINS server database. Opnum: 9
<u>R WinsSetPriorityClass</u>	Modifies the priority class of a WINS process running on the target WINS server. Opnum: 10
<u>R WinsResetCounters</u>	Resets all the pull replication partners counters stored at the target WINS server. Opnum: 11
<u>R WinsWorkerThdUpd</u>	Modifies the number of NetBIOS threads to a new value at the target WINS server. Opnum: 12
R WinsGetNameAndAdd	Retrieves the NetBIOS name and the corresponding IP address of the target WINS server. Opnum: 13
<u>R</u> WinsGetBrowserNames Old	This method SHOULD not be used. Opnum: 14
<u>R WinsDeleteWins</u>	Deletes all the records owned by a particular WINS server from the target WINS server database. Opnum: 15
<u>R WinsSetFlags</u>	This method SHOULD not be used. Opnum: 16
<u>R</u> WinsGetBrowserNames	Retrieves the Browser Names information stored at the target WINS server. Opnum: 17

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

Method	Description
<u>R WinsGetDbRecsByName</u>	Retrieves records matching a specified owner address from the target WINS server database. Opnum: 18
<u>R WinsStatusNew</u>	Retrieves various configuration settings and the statistics of a WINS server. Opnum: 19
<u>R WinsStatusWHdl</u>	Retrieves various configuration settings and the statistics of a WINS server. Opnum: 20
R_WinsDoScavengingNew	Requests a Scavenging operation at the target WINS server. Opnum: 21

3.1.4.1 R_WinsRecordAction (Opnum 0)

The **R_WinsRecordAction** method inserts, modifies, deletes, releases, or queries a name record from the WINS database.

```
DWORD R_WinsRecordAction(
   [in] handle_t ServerHdl,
   [in, out, ref] PWINSINTF_RECORD_ACTION_T* ppRecAction
);
```

- **ServerHdl:** An RPC binding over IP address/**HostName** to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.<3>
- **ppRecAction:** A pointer to a <u>WINSINTF RECORD ACTION T</u> structure (section 2.2.2.3) that contains the details of the record and the action to be performed on it. The interpretation of the member values in this structure depends on the type of action specified by the <u>WINSINTF ACT E</u> enumeration (section 2.2.1.4) value in its **Cmd_e** member, as follows.

WINSINTF_E_INSERT:

- **Cmd_e** is set to WINSINTF_E_INSERT.
- **pName** points to a null-terminated string that contains the NetBIOS name and optionally the NetBIOS scope name of the record.
- **NameLen** contains the length of the string specified by **pName**.
- TypOfRec_e is set to a value between 0x00000000 and 0x00000003 based on the record type.
- **NoOfAdds** is set to a positive value based on the number of IP address mappings that the record has.
- **pAdd** or **Add** is set with the mapping IP addresses, based on the **TypOfRec_e** member.
- **VersNo** SHOULD be ignored by the server. The inserted record MUST be marked with the current version number that is in use at the WINS server.

- **NodeTyp** is set to a value between 0x00 and 0x03 based on the type of the node.
- **OwnerId** SHOULD be ignored by the server. The record MUST be inserted into the database with the **OwnerId** member set to the target WINS server address.
- **State_e** SHOULD be ignored by the server. The record MUST be inserted into the database with its state marked as **ACTIVE**.
- **fStatic** is set to 0x00000001 if the record being inserted is a static record; otherwise, it is set to 0x00000000.
- **TimeStamp** SHOULD be ignored by the server. The inserted record SHOULD be timestamped with zero if the **fStatic** member is set to 0x00000001; otherwise, it SHOULD be time-stamped with the current time on the server plus the refresh interval configured on the server.

WINSINTF_E_DELETE:

- **Cmd_e** is set to WINSINTF_E_DELETE.
- **pName** points to a null-terminated string that contains the NetBIOS name and optionally the NetBIOS scope name of the record to be deleted from the database.
- **NameLen** contains the length of the string specified by **pName**.
- **State_e** is set to 0x0000003.
- All other members SHOULD be ignored by the server.

WINSINTF_E_RELEASE:

- **Cmd_e** is set to WINSINTF_E_RELEASE.
- **pName** points to a null-terminated string that contains the NetBIOS name and optionally the NetBIOS scope name of the record.
- **NameLen** contains the length of the string specified by **pName**.
- **TypOfRec_e** is set to a value between zero and 0x00000003 based on the record type.
- NoOfAdds MUST be set to 0x0000001.
- **pAdd** or **Add** is set with the mapping IP address based on the **TypOfRec_e** member.
- VersNo, NodeTyp, OwnerId, and fStatic SHOULD be ignored by the server.
- State_e SHOULD be ignored by the server. The record MUST be inserted with state marked as RELEASED.
- **TimeStamp** SHOULD be ignored by the server. The released record SHOULD be timestamped with 0xFFFFFFF if the **fStatic** member is set to 0x00000001; otherwise, it SHOULD be time-stamped with the current time on the server plus the tombstone interval configured on the server.

WINSINTF_E_MODIFY:

• **Cmd_e** is set to WINSINTF_E_MODIFY.

Copyright © 2011 Microsoft Corporation.

- **pName** points to a null-terminated string that contains the NetBIOS name and optionally the NetBIOS scope name of the record to be modified in the database.
- NameLen contains the length of the string specified by pName.
- **TypOfRec_e** contains the record type to be set for the record matching the **pName** member in the WINS database.
- **NodeTyp** contains the node type to be set for the record matching the **pName** member in the WINS database.
- **State_e** contains the state to be set for the record matching the **pName** member in the WINS database.
- **fStatic** contains the value to be set for the record matching the **pName** member in the WINS database.
- All other members SHOULD be ignored by the server.

WINSINTF_E_QUERY:

- **Cmd_e** is set to WINSINTF_E_QUERY.
- **pName** points to a null-terminated string that contains the NetBIOS name and optionally the NetBIOS scope name of the record to be queried from the database.
- **NameLen** contains the length of the string specified by **pName**.
- All other members act as output, which are filled by the server if a matching entry is found in the database.
- **TypOfRec_e** contains the matching record type.
- If the TyeOfRec_e member is set to 0x0000000 or 0x00000001, the NoOfAdds member SHOULD contain 0x00000001 or the number of IP addresses that are mapped to the name given in the pName member.
- If the TypOfRec_e member is set to 0x0000002 or 0x00000003. The RPC method caller SHOULD refer to this member for the set of IP addresses mapped to the name given in the pName member.
- If the TypOfRec_e member is set to 0x0000000 or 0x00000001. The RPC method caller SHOULD refer to this member for the IP address mapped to the name given in the pName member. If the TypOfRec_e member is set to 0x00000001, the IPAdd member of the Add structure MUST contain 0xFFFFFFF.
- **VersNo** contains the version number of the matching record.
- NodeTyp contains the node type of the matching record.
- **OwnerId** contains the IP address of the owner of the matching record.
- **State_e** contains the state of the matching record.
- **fStatic** contains the value 0x00000001 if the record is entered into the database by an administrator; otherwise, it contains 0x00000000.
- **TimeStamp** contains the time stamp of the record.

Return Values: A 32-bit unsigned integer value that indicates return status. A return value of ERROR_SUCCESS indicates that the operation was completed successfully. Otherwise, the **TimeStamp** member SHOULD contain one of the following Win32 error codes, as specified in [MS-ERREF]:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000FA5 ERROR_REC_NON_EXISTENT	The name does not exist in the database. This error is returned only if a requested WINSINTF_E_QUERY operation is not successful.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The **Opnum** value for this method is 0.

When processing this call, the WINS server MUST do the following:

- If the action specified is WINSINTF_E_QUERY, the RPC method caller SHOULD have query level access.
 Section Structure Should have control level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- The WINS service on the target WINS server MUST be in the running or paused state for this method to complete successfully. If the service is in initializing or exiting state, ERROR_WINS_INTERNAL status SHOULD be returned.
- When the RPC method is called with an action set to WINSINTF_E_INSERT, the requested record is inserted into the database. If the record with the same name already exists in the database, name resolution occurs as described in [MS-WINSRA]. The server returns ERROR_WINS_INTERNAL, if any error occurs while performing the resolution or inserting the record.<5>
- When an RPC method is called with the action set to WINSINTF_E_RELEASE, the state of the matching record is changed to RELEASED in the database. If a matching record is not found, the server returns ERROR_SUCCESS. If any failure occurs during the modification of the record state, ERROR_WINS_INTERNAL is returned.
- When an RPC method is called with the action set to WINSINTF_E_MODIFY, the database is searched for a matching record. If a match is found, the attributes of the record such as record type, node type, record state, and *fstatic* are modified according to the requested values. If the matching record's type is either unique or Normal Group and a request comes to modify it to multihomed or Special Group, respectively, an ERROR_WINS_INTERNAL error is returned; otherwise, ERROR_SUCCESS is returned. If the record is not found in the database, the server returns ERROR_SUCCESS.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

- When the RPC method is called with the action set to WINSINTF_E_QUERY, the database is queried for the given name. If a matching record is found, the attributes of the record are returned to the RPC caller. If the record is not found or if any error occurs during attribute retrieval, the server returns an ERROR_REC_NON_EXISTENT error.
- When the RPC method is called with the action set to WINSINTF_E_DELETE, the matching record is deleted from the database. If a matching record is not found in the database, an ERROR_SUCCESS status code is returned. If any error occurs during the database operations, an ERROR_WINS_INTERNAL is returned. The RPC method caller MUST set *state_e* to DELETED for this action to succeed.

3.1.4.2 R_WinsStatus (Opnum 1)

The **R_WinsStatus** method retrieves configuration settings and statistics from a WINS server.

```
DWORD R_WinsStatus(
   [in] handle_t ServerHdl,
   [in] WINSINTF_CMD_E Cmd_e,
   [in, out, ref] PWINSINTF_RESULTS_T pResults
);
```

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.
- **Cmd_e:** The command to be executed on the target WINS server from the <u>WINSINTF_CMD_E</u> enumeration (section <u>2.2.1.5</u>).
- **pResults:** A pointer to a <u>WINSINTF RESULTS T</u> structure (section <u>2.2.2.7</u>) that contains configuration data and statistics for the target WINS server.
- **Return Values:** A 32-bit unsigned integer value that indicates return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. Otherwise, this return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned.

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to the WINS server that processes a call to ${\bf R}_{\bf WinStatus}$:

The R_WinStatus caller SHOULD have query level access.
 4.5 If an RPC client with a lower access level calls R_WinStatus, the server SHOULD return ERROR_ACCESS_DENIED.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

- The WINS service on the target WINS server MUST be in the running or paused state. If the service is in initializing or exiting state, the server SHOULD return ERROR_WINS_INTERNAL.
- When **R_WinStatus** is called with the **Cmd_e** parameter set to WINSINTF_E_ADDVERSMAP, the first entry of the *AddVersMaps* array SHOULD contain the address of the WINS server for which the version number is requested. The WINSINTF_E_ADDVERSMAP command retrieves the version number for the specified owner address from the owner version map of the target WINS server. The retrieved version number is stored in the *AddVersMaps[0].VersNo* parameter. If the address of the **owner WINS server** is not found in the owner-version map of the target WINS server, an ERROR_WINS_INTERNAL error is returned.
- When **R_WinStatus** is called with the *Cmd_e* parameter set to WINSINTF_E_CONFIG, the *pResults* parameter is used only for output. The *NoOfOwners* and *AddVersMaps* parameters specify the owner version map table maintained on the target WINS server. If the owner version map table has more than 25 entries, only the first 25 entries are copied to *pResults*->*AddVersMaps*. The *RefreshInterval*, *TombstoneInterval*, *TombstoneTimeout*, *VerifyInterval*, *WINSPriorityClass*, and *NoOfWorkerThds* members get values according to the configuration of the target WINS server. The *WINSStat* parameter is not used for this command. An ERROR_WINS_INTERNAL error is returned if any error occurs during processing of a WINSINTF_E_CONFIG command.
- When R_WinStatus is called with the Cmd_e parameter set to WINSINTF_E_CONFIG_ALL_MAPS, the behavior is the same as specified for the WINSINTF_E_CONFIG command except that the owner version map entry is returned even if it is marked as deleted.
- When R_WinStatus is called with the Cmd_e parameter set to WINSINTF_E_STAT, the *pResults* parameter is used only for output. Statistics for the target WINS server are copied to *pResults*->*WINSStat*. The *pResults*->*WINSStat.pRpIPnrs* pointer MUST be NULL for this operation to succeed. The WINSINTF_E_STAT command also retrieves the information retrieved by the WINSINTF_E_CONFIG command. An ERROR_WINS_INTERNAL error is returned if any error occurs during processing of a WINSINTF_E_STAT command.

3.1.4.3 R_WinsTrigger (Opnum 2)

The **R_WinsTrigger** method triggers a replication operation between a target WINS server and another WINS server.

```
DWORD R_WinsTrigger(
  [in] handle_t ServerHdl,
  [in, ref] PWINSINTF_ADD_T pWinsAdd,
  [in] WINSINTF_TRIG_TYPE_E TrigType_e
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.

pWinsAdd: Address of the WINS server with which the target WINS server performs the replication operation.

TrigType_e: The type of replication operation requested.

Return Values: A 32 bit unsigned integer value that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. Any

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

other return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000FA6 ERROR_RPL_NOT_ALLOWED	The WINS server requested for the replication operation is requested is not configured as a replication partner for the target WINS server.
0x00000005 ERROR_ACCESS_DENIED	The caller does not have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

When **R_WinsTrigger** is called, the server returns immediately without waiting for the replication operation to finish. The server just queues a request for the replication operation, and the replication takes place at a time determined by the internal state and configuration of the target WINS server. Hence, applications that call **R_WinsTrigger** SHOULD NOT treat an ERROR_SUCCESS return value as indicating a successful replication operation. Instead, applications SHOULD rely on WINS event logs to determine whether or not replication is successful.

The following requirements and recommendations apply to a WINS server that processes a call to **R_WinsTrigger**:

- The **R_WinsTrigger** caller SHOULD have control level access. If an RPC client with a lower access level calls **R_WinsTrigger**, the server SHOULD return ERROR_ACCESS_DENIED.
- The WINS service on the target WINS server MUST be in the running or paused state. If the service is in initializing or exiting state, the server SHOULD return ERROR_WINS_INTERNAL for its status.
- When R_WinsTrigger is called with trigger type WINSINTF_E_PUSH, the server queues a push replication. If the target WINS server is configured to replicate only with partners and the address of the requested replication partner is not in the server's list of push replication partners, the server SHOULD return WINSINTF_RPL_NOT_ALLOWED. The server can also return ERROR_WINS_INTERNAL for any other errors occur while it processes the request.
- The trigger type WINSINTF_E_PUSH_PROP works same way as the command WINSINTF_E_PUSH except that the update notifications that are sent as part of push replication have the propagate opcode set [MS-WINSRA].
- When the **R_WinsTrigger** method is called with trigger type WINSINTF_E_PULL, the server queues a pull replication as specified by the *pWinsAdd* parameter. If the target WINS server is configured to replicate only with partners, and the address of the requested replication partner is not in the server's list of pull replication partners, the server SHOULD return WINSINTF_RPL_NOT_ALLOWED. Also, the server SHOULD return ERROR_WINS_INTERNAL for any other errors that occur while it processes the request.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

3.1.4.4 R_WinsDoStaticInit (Opnum 3)

The **R_WinsDoStaticInit** method performs static initialization of a WINS database by registering the names specified in a data file.

```
DWORD R_WinsDoStaticInit(
   [in] handle_t ServerHdl,
   [in, unique, string] LPWSTR pDataFilePath,
   [in] DWORD fDel
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to resolve which WINS server the call is directed to.

pDataFilePath: A pointer to a **Unicode string** containing the path to a text file on the target WINS server. The file SHOULD contain entries that map NetBIOS names to **IPv4 addresses** in string format using the following syntax:

<IPv4 address 1> <one or more spaces> <NetBIOS name 1> <IPv4 address 2> <one or more spaces> <NetBIOS name 2> ... <IPv4 address N> <one or more spaces> <NetBIOS name N>

An example of this syntax can be found in the Windows **LMHOSTS** file. See [LMHOSTS] for more information.

If this pointer value is NULL, the target WINS server SHOULD use the following default path: "%systemroot%\system32\drivers\etc\lmhosts".

- **fDel:** Value specifying whether or not to delete the file specified by *pDataFilePath* from the target WINS server. A non-zero value deletes the file from the target WINS server after the database initialization is complete.
- **Return Values:** A 32 bit unsigned integer value that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. Any other return value is a Win32 error code as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000FA2 ERROR_STATIC_INIT_FAILED	An error occurred during static initialization of the database file.
0x00000005 ERROR_ACCESS_DENIED	The caller does not have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

The following requirements and recommendations apply to a WINS server that processes a call to **R_WinsDoStaticInit**:

- The **R_WinsDoStaticInit** caller SHOULD have control level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- The WINS server retrieves the entries from the specified file and registers the retrieved names into the WINS database.
- After the WINS server finishes the initialization, it removes the file if *fDel* is set to a nonzero value.
- The WINS server SHOULD return ERROR_STATIC_INIT_FAILED if any error occurs while the server is reading the file or registering the names in the database.

3.1.4.5 R_WinsDoScavenging (Opnum 4)

The **R_WinsDoScavenging** method queues a scavenging request on the target WINS server.

```
DWORD R_WinsDoScavenging(
   [in] handle_t ServerHdl
);
```

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.
- **Return Values:** A 32 bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x0000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

When **R_WinsDoScanvenging** is called, the server returns immediately without waiting for scavenging to start. The server just queues a request for the scavenging operation, and the internal state and configuration of the WINS server determine whether or not the scavenging occurs. Hence, callers to **R_WinsDoScanvenging** SHOULD NOT treat a return code of ERROR_SUCCESS as indicating a successful scavenging operation. Instead, callers SHOULD rely on WINS event logs to determine whether or not the scavenging operation succeeded.

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsDoScavenging</u>**:

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

- Callers to R_WinsDoScavenging SHOULD have control level access. If an RPC client with a lower access level calls R_WinsDoScavenging, the server SHOULD return ERROR_ACCESS_DENIED.
- The WINS server queues a request on the target WINS server for the scavenging operation, and the method returns immediately with ERROR_SUCCESS as the status code.

3.1.4.6 R_WinsGetDbRecs (Opnum 5)

The **R_WinsGetDbRecs** method returns the records whose version numbers are within a specified range and that are owned by a specified WINS server.

```
DWORD R_WinsGetDbRecs(
   [in] handle_t ServerHdl,
   [in, ref] PWINSINTF_ADD_T pWinsAdd,
   [in] WINSINTF_VERS_NO_T MinVersNo,
   [in] WINSINTF_VERS_NO_T MaxVersNo,
   [out] PWINSINTF_RECS_T pRecs
);
```

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding to resolve which WINS server the call is directed to.
- **pWinsAdd:** Address of an owner WINS server whose records are retrieved from the target WINS server.

MinVersNo: The lower bound on the version range of the records to be retrieved.

MaxVersNo: The upper bound on the version range of the records to be retrieved.

- **pRecs:** Pointer to a structure of type <u>WINSINTF RECS T</u>, which contains the records retrieved from the target WINS server.
- **Return Values:** A 32-bit unsigned integer value that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation finished successfully. Any nonzero value is a Win32 error code, as specified in <u>[MS-ERREF]</u>. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000005 ERROR_ACCESS_DENIED	The caller does not have sufficient permissions.

Exceptions Thrown: No exceptions SHOULD be thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsGetDbRecs</u>**:

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

- The RPC method caller SHOULD have query-level access.
 If an RPC client with a lower access level calls **R_WinsGetDbRecs**, the server SHOULD return ERROR_ACCESS_DENIED.
- In response to a R_WinsGetDbRecs call, records are retrieved from the target WINS server database if their version numbers fall between *MinVersNo* and *MaxVersNo*, and if the records are owned by the owner WINS server whose address is specified by *pWinsAdd*.
- If the R_WinsGetDbRecs caller specifies zero for both *MinVersNo* and *MaxVersNo*, all records owned by the WINS server specified by *pWinsAdd* are retrieved from the target WINS server's database.
- The *MinVersNo* value MUST be less than or equal to *MaxVersNo* value for the **R_WinsGetDbRecs** call to succeed; otherwise, the server SHOULD return ERROR_WINS_INTERNAL.

The **R_WinsGetDbRecs** caller is responsible for freeing the memory pointed to by *pRecs->pRow->pName* and *pRecs->pRow->pAdd* for each record, then using the **midl_user_free** function (section <u>3</u>) to free the *pRecs->pRow* and *pRecs* pointers themselves.

3.1.4.7 R_WinsTerm (Opnum 6)

The **R_WinsTerm** method sends a termination signal to the WINS process on a target WINS server.

```
DWORD R_WinsTerm(
  [in] handle_t ServerHdl,
  [in] SHORT fAbruptTem
);
```

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.
- **fAbruptTem:** A value that indicates whether the WINS process terminates immediately. If this value is nonzero, the service terminates immediately. Otherwise, the service exits normally and frees all resources.
- **Return Values:** A 32 bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x0000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions SHOULD be thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsTerm</u>**:

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

- The **R_WinsTerm** caller SHOULD have control level access. If an RPC client with a lower access level calls **R_WinsTerm**, the server SHOULD return ERROR_ACCESS_DENIED.
- **R_WinsTerm** always returns ERROR_SUCCESS if the client has sufficient access level permissions.
- If *fAbruptTem* is set to a nonzero value, the service exits immediately. Otherwise, the service frees all the resources and then calls the exit process.

3.1.4.8 R_WinsBackup (Opnum 7)

The **R_WinsBackup** method backs up the WINS database to a specified directory.

```
DWORD R_WinsBackup(
  [in] handle_t ServerHdl,
  [in, string, ref] LPBYTE pBackupPath,
  [in] SHORT fIncremental
);
```

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.
- **pBackupPath:** A pointer to a string that contains the name of the directory to which to back up the database. This pointer MUST not be NULL.

fIncremental: A value that is ignored.

Return Values: A 32-bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. Any nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned.

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000FA4 ERROR_FULL_BACKUP	The backup failed. Check the directory to which you are backing up the database.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsBackup</u>**:

• The **R_WinsBackup** caller SHOULD have control level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

- The server returns ERROR_WINS_INTERNAL if *pBackupPath* points to a string that is longer than 255 characters.
- The database is always backed up to the path specified by *pBackupPath* with the string
 "\wins_bak\" appended. If the client doesn't have sufficient permissions to create files in the
 specified directory or if the backup fails for any other reasons, the server SHOULD return an
 ERROR_FULL_BACKUP error.

3.1.4.9 R_WinsDelDbRecs (Opnum 8)

The **R_WinsDelDbRecs** method deletes the records whose version numbers are within a specified range and that are owned by a specified WINS server.

```
DWORD R_WinsDelDbRecs(
   [in] handle_t ServerHdl,
   [in, ref] PWINSINTF_ADD_T pWinsAdd,
   [in] WINSINTF_VERS_NO_T MinVersNo,
   [in] WINSINTF_VERS_NO_T MaxVersNo
);
```

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.
- **pWinsAdd:** A pointer to an owner WINS server address whose records are to be deleted from the target WINS server.

MinVersNo: The lower bound on the version number of the records to be deleted.

MaxVersNo: The upper bound on the version number of the records to be deleted.

Return Values: A 32-bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. Any nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned.

Return value/code	Description
0x0000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsDelDbRecs</u>**:

 The R_WinsDelDbRecs caller SHOULD have control-level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

- If the target WINS server doesn't have any records owned by the WINS server whose address is specified by *pWinsAdd*, the server SHOULD return ERROR_WINS_INTERNAL.
- Records are deleted from the target WINS server database if their version numbers fall between the values of *MinVersNo* and *MaxVersNo* and if they are owned by the WINS server whose address is specified in *pWinsAdd*.
- If both *MinVersNo* and *MaxVersNo* are set to zero, all records owned by the WINS server whose address is specified in *pWinsAdd* are deleted.

3.1.4.10 R_WinsPullRange (Opnum 9)

The **R_WinsPullRange** method pulls a range of records owned by a WINS server from another WINS server, and replicates them within the target WINS server database. $\leq 8 \geq$

```
DWORD R_WinsPullRange(
  [in] handle_t ServerHdl,
  [in, ref] PWINSINTF_ADD_T pWinsAdd,
  [in, ref] PWINSINTF_ADD_T pOwnerAdd,
  [in] WINSINTF_VERS_NO_T MinVersNo,
  [in] WINSINTF_VERS_NO_T MaxVersNo
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.

pWinsAdd: The address of the WINS server from which the entries are pulled.

pOwnerAdd: The address of the owner WINS server whose entries are pulled.

MinVersNo: The lower bound on the range of version numbers for the records to be pulled.

MaxVersNo: The upper bound on the range of version numbers for the records to be pulled.

Return Values: A 32 bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x0000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

When **R_WinsPullRange** is called, the server returns immediately without waiting for the actual pull. It just queues a request for the pull operation, and the actual pull starts at a time determined by the current state and configuration of the target WINS server. Hence, **R_WinsPullRange** callers SHOULD NOT treat an ERROR_SUCCESS return value as indicating a successful pull operation. Instead, callers SHOULD rely on WINS event logs to determine whether or not the pull operation succeeded.

The following requirements and recommendations apply to a WINS server that processes a call to **R_WinsPullRange**:

- **R_WinsPullRange** callers SHOULD have control level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- The value of *MinVersNo* MUST be less than or equal to the value of *MaxVersNo*. Otherwise, the server SHOULD return ERROR_WINS_INTERNAL.
- If the target WINS server is configured to pull records only from configured partners, the WINS server address given in *pWinsAdd* MUST have been configured as a pull partner for the target WINS server. Otherwise, the server SHOULD return ERROR_WINS_INTERNAL.
- When the client queues a request to pull the records owned by the server whose address is given in *pOwnerAdd* from the WINS server whose address is given in *pWinsAdd*, the RPC call SHOULD return immediately without waiting for the replication operation to complete.

3.1.4.11 R_WinsSetPriorityClass (Opnum 10)

The **R_WinsSetPriorityClass** method sets the priority class for the WINS process running on the target WINS server.

```
DWORD R_WinsSetPriorityClass(
  [in] handle_t ServerHdl,
  [in] WINSINTF_PRIORITY_CLASS_E PrCls_e
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.

PrCls_e: The priority class to be set.

Return Values: A 32 bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x0000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsSetPriorityClass</u>**:

- The **R_WinsSetPriorityClass** caller SHOULD have control level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- If *PrCls_e* is set to a value other than WINSINTF_E_NORMAL or WINSINTF_E_HIGH, the server SHOULD return ERROR_WINS_INTERNAL.
- The server sets the priority class of the WINS process to the one specified by *PrsCls_e*.

3.1.4.12 R_WinsResetCounters (Opnum 11)

The **R_WinsResetCounters** method resets the pull replication counters for all partners of the target WINS server.

```
DWORD R_WinsResetCounters(
   [in] handle_t ServerHdl
):
```

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.
- **Return Values:** A 32 bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsResetCounters</u>**:

- The **R_WinsResetCounters** caller SHOULD have control level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- Each WINS server maintains one <u>WINSINTF RPL COUNTERS T</u> structure (section <u>2.2.2.5</u>) per configured pull partner to track the number of successful pull replications and the number of communication failures. The **R_WinsResetCounters** method resets to zero the values of the

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

NoOfRpls and **NoOfCommFails** members of the **WINSINTF_RPL_COUNTERS_T** structures for all the configured pull partners of the target WINS server.

• This method MUST return ERROR_SUCCESS if the client has sufficient access level permissions.

3.1.4.13 R_WinsWorkerThdUpd (Opnum 12)

The **R_WinsWorkerThdUpd** method updates the number of threads that have been created to serve NetBIOS requests.

DWORD R_WinsWorkerThdUpd(
 [in] handle_t ServerHdl,
 [in] DWORD NewNoOfNbtThds
);

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.

NewNoOfNbtThds: New value for the number of worker threads that have been created for NetBIOS requests.

Return Values: A 32 bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsWorkerThdUpd</u>**:

- The **R_WinsWorkerThdUpd** caller SHOULD have control level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- The WINS service MUST be in the running or paused state for this method to succeed. If the service is in the initializing or exiting state, the server SHOULD return ERROR_WINS_INTERNAL.
- The new number given in *NewNoOfNbtThds* MUST be in the range 2 through 19, inclusive. Otherwise, the server SHOULD return an ERROR_WINS_INTERNAL error.
- The R_WinsWorkerThdUpd call sets the number of worker threads that serve NetBIOS
 requests to the new number given in NewNoOfNbtThds. If the existing number of NetBIOS

[[]MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

threads is same as the requested number, the RPC call SHOULD return immediately. Otherwise, NetBIOS threads are created or deleted to adjust the total number of threads to the requested number.

3.1.4.14 R_WinsGetNameAndAdd (Opnum 13)

The **R_WinsGetNameAndAdd** method retrieves the NetBIOS name and the corresponding IP address of the target WINS server.

```
DWORD R_WinsGetNameAndAdd(
  [in] handle_t ServerHdl,
  [out, ref] PWINSINTF_ADD_T pWinsAdd,
  [out, string, size_is(80)] LPBYTE pUncName
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.

pWinsAdd: A pointer to a structure containing the IP address of the target WINS server.

- **pUncName:** A pointer to a null-terminated string containing the NetBIOS name of the target WINS server.
- **Return Values:** A 32 bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsGetNameAndAdd</u>**:

- The R_WinsGetNameAndAdd caller SHOULD have query-level access.
 If an RPC client with
 a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- The structure that *pWinsAdd* points to contains only an IP address. The **R_WinsGetNameAndAdd** caller SHOULD ignore the other fields of the structure.
- The server retrieves the NetBIOS name by calling a standard Windows function, which returns the status code directly to the caller without any modification. Hence, any Win32 error code can be returned, as specified in [MS-ERREF].

3.1.4.15 R_WinsGetBrowserNames_Old (Opnum 14)

The **R_WinsGetBrowserNames_Old** method always returns an ERROR_WINS_INTERNAL error code.

```
DWORD R_WinsGetBrowserNames_Old(
   [in] handle_t ServerHdl,
   [out] PWINSINTF_BROWSER_NAMES_T pNames
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.

pNames: This field MUST be ignored.

Return Values: A 32-bit unsigned integer value that indicates the return status. The method always returns the ERROR_WINS_INTERNAL error code.

Return value/code	Description
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.

Exceptions Thrown: No exceptions are thrown.

Processing and Response Requirements:

Clients with any access level can call this method.

3.1.4.16 R_WinsDeleteWins (Opnum 15)

The **R_WinsDeleteWins** method deletes all the records owned by a particular WINS server from the target WINS server database.

```
DWORD R_WinsDeleteWins(
  [in] handle_t ServerHdl,
  [in, ref] PWINSINTF_ADD_T pWinsAdd
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.

pWinsAdd: A pointer to the address of the owner WINS server whose records are to be deleted from the target WINS server.

Return Values: A 32 bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

Return value/code	Description
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsDeleteWins</u>**:

- The RPC method caller SHOULD have control-level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- If *pWinsAdd* contains the IP address of the target WINS, the records are deleted immediately
 from the target WINS server database. If the server encounters an error while retrieving the
 records from the database, it SHOULD return ERROR_WINS_INTERNAL; otherwise, the server
 returns ERROR_SUCCESS.
- If *pWinsAdd* contains an IP address different from the target WINS server address, a request is queued at the target WINS server, and the RPC call returns immediately with ERROR_SUCCESS status.

3.1.4.17 R_WinsSetFlags (Opnum 16)

The **R_WinsSetFlags** method always returns ERROR_SUCCESS.

```
DWORD R_WinsSetFlags(
   [in] handle_t ServerHdl,
   [in] DWORD fFlags
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.

fFlags: This field MUST be ignored.

Return Values: A 32-bit unsigned integer value that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully.

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.

Exceptions Thrown: No exceptions are thrown.

Processing and Response Requirements:

Clients with any access level can call this method.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

3.1.4.18 R_WinsGetBrowserNames (Opnum 17)

The **R_WinsGetBrowserNames** method retrieves browser name records from the target WINS server database.

```
DWORD R_WinsGetBrowserNames(
   [in, ref] WINSIF_HANDLE ServerHdl,
   [out] PWINSINTF_BROWSER_NAMES_T pNames
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to. See [MSDN-Handles] for more information.

This value MUST be ignored by the WINS server on receipt.

pNames: A pointer to a structure of type <u>WINSINTF_BROWSER_NAMES_T (section</u> <u>2.2.2.10</u>), which contains the browser name records retrieved from the target WINS server.

Return Values: A 32-bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x0000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.

Exceptions Thrown: No exceptions SHOULD be thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

Clients with any access level can call this method.

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsGetBrowserNames</u>**:

- This method retrieves all browser name records in the target WINS server database.
- If the Browser name cache abstract data element (section <u>3.1.1</u>) has been populated, and less than 3 minutes have elapsed since it was last updated, this method SHOULD return the records from the cache by using the *pNames* parameter.
- If this method call is being made for the first time, or if 3 minutes or more have elapsed since the **Browser name cache** was last updated, the cache SHOULD be refreshed by fetching records from the database, and the contents of the cache are returned.
- If any error occurs while retrieving the records, the service SHOULD return an ERROR_WINS_INTERNAL error code.

The **R_WinsGetBrowserNames** caller is responsible for freeing the memory pointed to by *pRecs*-*pRow*-*pName* and *pRecs*-*pRow*-*pAdd* for each record, then using the **midl_user_free** function (section <u>3</u>) to free the *pRecs*-*pRow* and *pRecs* pointers themselves.

3.1.4.19 R_WinsGetDbRecsByName (Opnum 18)

The **R_WinsGetDbRecsByName** method retrieves records matching an owner address from a target WINS server database starting at a specified cursor.

```
DWORD R_WinsGetDbRecsByName(
  [in] handle_t ServerHdl,
  [in, unique] PWINSINTF_ADD_T pWinsAdd,
  [in] DWORD Location,
  [in, unique, size_is(NameLen + 1)]
   LPBYTE pName,
  [in] DWORD NameLen,
  [in] DWORD NoOfRecsDesired,
  [in] DWORD fOnlyStatic,
  [out] PWINSINTF_RECS_T pRecs
);
```

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.
- **pWinsAdd:** A pointer to the address of the owner WINS server whose records are to be retrieved. If the pointer is NULL, the records for all owners are retrieved.
- **Location:** A value specifying the direction in which the database is searched. If the value is zero, the database is searched forward starting from the beginning. If the value is 1, the database is searched backward starting from the last record of the database.

pName: A pointer to a name that specifies the cursor from which the database retrieval starts.

NameLen: The length of the name that *pName* points to, including terminating null character.

NoOfRecsDesired: The number of records to be retrieved from the database.

fOnlyStatic: Takes a value of 1, 2, or 4 to indicate whether static records, dynamic records, or both are retrieved. A value of 1 retrieves only static records. A value of 2 retrieves only dynamic records. A value of 4 retrieves both static records and dynamic records.

pRecs: A pointer to a structure containing the retrieved records.

Return Values: A 32 bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Return value/code	Description
0x00000FA5 ERROR_REC_NON_EXISTENT	No records were found matching the given data.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions SHOULD be thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsGetDbRecsByName</u>**:

- The RPC method caller SHOULD have query-level access.<11> If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- This method returns all records whose owner address matches the address specified in
 pWinsAdd. If *pName* points to a valid name, the database search starts from the record after the
 record whose name matches the valid name. If the name that *pName* points to does not match
 the name for any database records, the database search starts from the beginning of the
 database.
- A maximum of 5,000 records can be retrieved in a single call.
- If the owner's address is specified and if the server can't find this address in its owner version map, the server returns error ERROR_WINS_INTERNAL error.
- If no records match the search criteria, the server returns an ERROR_REC_NON_EXISTENT error. For any other error conditions, the server returns an ERROR_WINS_INTERNAL error.
- Refer to <u>Retrieving All the Records of a WINS Database (section 4.6)</u> to see how to use **R_WinsGetDbRecsByName** to retrieve all the records of a database.

The **R_WinsGetDbRecsByName** caller is responsible for freeing the memory pointed to by *pRecs*-*pRow*-*pName* and *pRecs*-*pRow*-*pAdd* for each record, then using the **midl_user_free** function (section <u>3</u>) to free the *pRecs*-*pRow* and *pRecs* pointers themselves.

3.1.4.20 R_WinsStatusNew (Opnum 19)

The **R_WinsStatusNew** method retrieves configuration settings and statistics from a WINS server.

```
DWORD R_WinsStatusNew(
   [in] handle_t ServerHdl,
   [in] WINSINTF_CMD_E Cmd_e,
   [out] PWINSINTF_RESULTS_NEW_T pResults
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.

Cmd_e: The command to be executed on the target WINS server, from the **WINSINTF CMD E** enumeration (section 2.2.1.5).

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

- **pResults:** A pointer to a <u>WINSINTF_RESULTS_NEW_T</u> structure (section <u>2.2.2.11</u>), which contains the results of the command execution.
- **Return Values:** A 32-bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x0000000 ERROR_SUCCESS	The call was successful.
0x00000005 ERROR_ACCESS_DENIED	The caller does not have sufficient permissions.
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.

Exceptions Thrown: No exceptions SHOULD be thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

- The behavior of this method is exactly same as that of <u>R WinsStatus</u> except for the following:
 - There is no limit on the number of entries in the address-version map array.
 - This method SHOULD NOT be called with Cmd_e set to WINSINTF_E_ADDVERSMAP. If it is, the server returns an ERROR_WINS_INTERNAL error.
- Refer to R_WinsStatus and WINSINTF_RESULTS_NEW_T for the details of the behavior of this method.

3.1.4.21 R_WinsStatusWHdl (Opnum 20)

The **R_WinsStatusWHdI** method retrieves various configuration settings and the statistics of a WINS server.

```
DWORD R_WinsStatusWHdl(
  [in, ref] WINSIF_HANDLE ServerHdl,
  [in] WINSINTF_CMD_E Cmd_e,
  [in, out, ref] PWINSINTF_RESULTS_NEW_T pResults
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to. See [MSDN-Handles] for more information.

This value MUST be ignored by the WINS server on receipt.

Cmd_e: The command to be executed on the target WINS server.

pResults: A pointer to a structure of type **WINSINTF RESULTS NEW T (section 2.2.2.11)** that contains the results of the command execution.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

Return Values: A 32-bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description	
0x00000000 ERROR_SUCCESS	The call was successful.	
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.	
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.	

The behavior of this method is the same as that of the **R_WinsStatusNew** method (section 3.1.4.20).

3.1.4.22 R_WinsDoScavengingNew (Opnum 21)

The **R_WinsDoScavengingNew** method requests a specific scavenging operation on the target WINS server.

```
DWORD R_WinsDoScavengingNew(
   [in] handle_t ServerHdl,
   [in, ref] PWINSINTF_SCV_REQ_T pScvReq
);
```

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to determine which WINS server the call is directed to.
- **pScvReq:** A pointer to a WINSINTF_SCV_REQ_T structure (section 2.2.2.12) that defines the type of scavenging operation.
- **Return Values:** A 32-bit unsigned integer that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. A nonzero return value is a Win32 error code, as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.
0x00000005 ERROR_ACCESS_DENIED	The caller doesn't have sufficient permissions.

Exceptions Thrown: No exceptions SHOULD be thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

When **<u>R</u>** <u>WinsDoScanvengingNew</u> is called, the method returns immediately without waiting for scavenging to start. The server just queues a request for the scavenging operation; the internal

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

state and configuration of the WINS server and the value of the *FForce* member in the **WINSINTF_SCV_REQ_T** structure (section <u>2.2.2.12</u>) determine whether the scavenging occurs. Hence, callers to **R_WinsDoScanvengingNew** SHOULD NOT treat a return code of ERROR_SUCCESS as indicating a successful scavenging operation. Instead, callers SHOULD rely on WINS event logs to determine whether or not the scavenging operation succeeded.

The following requirements and recommendations apply to a WINS server that processes a call to **<u>R WinsDoScavengingNew</u>**:

- Callers to R_WinsDoScavengingNew SHOULD have control level access. If an RPC client with a lower access level calls R_WinsDoScavengingNew, the server SHOULD return ERROR_ACCESS_DENIED.
- The WINS server queues a request on the target WINS server for the scavenging operation, and the method returns immediately with ERROR_SUCCESS as the status code.

3.1.5 Timer Events

No protocol timer events are required other than those in the underlying RPC protocol.

3.1.6 Other Local Events

No local events are maintained other than those in the underlying RPC protocol.

3.2 winsi2 Server Details

The methods supported by the **winsi2** interface are specified in <u>Message Processing Events and</u> <u>Sequencing Rules (section 3.2.4)</u>.

3.2.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation can maintain to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

A NetBIOS name server (NBNS) needs to maintain the following data structures:

Name record: A data structure that contains a name and the associated attributes.

Name records collection: A collection of all name records that are either registered by this NBNS server or obtained by replication.

Global version counter: A 64-bit unsigned integer that tracks the version number that is given to the next record to be updated.

Server configuration: Parameters maintained in persistent storage include the following:

- Refresh interval
- Extinction interval
- Extinction timeout
- Verify interval

- Process priority class
- Number of worker threads

3.2.2 Timers

No timers are required beyond those used internally by RPC to implement resiliency to network outages, as specified in [MS-RPCE] section 3.2.3.2.1.

3.2.3 Initialization

A WINS **winsi2** remote protocol server MUST be initialized by registering the RPC interface and listening on the dynamically allocated port assigned by RPC, as specified in section 2.1. The client MUST connect to a well-known RPC port on the WINS server to determine the endpoint of **winsi2**. Before any client connection, the WINS server MUST wait for WINS winsi2 to register with RPC before any clients can establish a connection.

3.2.4 Message Processing Events and Sequencing Rules

The **winsi2** interface provides methods that remotely configure, manage, and monitor a WINS server.

Method	Description	
<u>R_WinsTombstoneDbRecs</u>	Tombstones a specified range of records belonging to a particular owner. Opnum: 0	
<u>R WinsCheckAccess</u>	Checks the granted level of access for the RPC caller. Opnum: 1	

Methods in RPC Opnum Order

3.2.4.1 R_WinsTombstoneDbRecs (Opnum 0)

The **R_WinsTombstoneDbRecs** method tombstones records whose version numbers fall within a range of version numbers and are owned by a server with a specified address.

```
DWORD R_WinsTombstoneDbRecs(
  [in] handle_t ServerHdl,
  [in, ref] PWINSINTF_ADD_T pWinsAdd,
  [in] WINSINTF_VERS_NO_T MinVersNo,
  [in] WINSINTF_VERS_NO_T MaxVersNo
);
```

ServerHdl: An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to resolve which WINS server the call is directed to.

pWinsAdd: A pointer to the address of the owner WINS server whose records are to be tombstoned. This value MUST NOT be NULL.

MinVersNo: The lower bound on the range of version numbers that identifies the range of records to be tombstoned.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

- **MaxVersNo:** The upper bound on the range of version numbers that identifies the range of records to be tombstoned.
- **Return Values:** A 32 bit unsigned integer value that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. Any other return value is a Win32 error code as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description	
0x0000000 ERROR_SUCCESS	The call was successful.	
0x00000005 ERROR_ACCESS_DENIED	The caller does not have sufficient permissions.	
0x00000FA0 ERROR_WINS_INTERNAL	An error occurred while processing the RPC call.	

Exceptions Thrown: No exceptions SHOULD be thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

The following requirements and recommendations apply to a WINS server that processes a call to **R_WinsTombstoneDbRecs**:

- The **R_WinsTombstoneDbRecs** caller SHOULD have control-level access. If an RPC client with a lower access level calls this method, the server SHOULD return ERROR_ACCESS_DENIED.
- If the specified owner WINS server address is not found in the owner-version map table, the server SHOULD return ERROR_WINS_INTERNAL.
- If any error occurs during the retrieval or updating of database records, the server SHOULD return ERROR_WINS_INTERNAL.
- The server changes the state of the matching records to tombstoned. It also updates the version number and the ownership of these records so that the version number and record ownership are replicated on the partner WINS servers when replication takes place.
- The time stamp of the matching record is set to a string with the following format:

```
current time + tombstone timeout configured on the target WINS server
```

• If both *MinVersNo* and *MaxVersNo* are zero, all records matching the given owner address are tombstoned.

3.2.4.2 R_ WinsCheckAccess (Opnum 1)

The **R_ WinsCheckAccess** method retrieves the level of access the client is granted.<22>

```
DWORD R_WinsCheckAccess(
   [in] handle_t ServerHdl,
   [out] DWORD* Access
);
```

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

- **ServerHdl:** An RPC binding over IP address/HostName to the WINS server. RPC uses this binding internally to resolve which WINS server the call is directed to.
- **Access:** Pointer to the access level value. This value MUST not be NULL. The following values are possible as output.

Name	Value
No access	0
Control level access	1
Query level access	2

Return Values: A 32-bit unsigned integer value that indicates the return status. A return value of ERROR_SUCCESS (0x0000000) indicates that the operation completed successfully. Any other return value is a Win32 error code as specified in [MS-ERREF]. The following Win32 error codes can be returned:

Return value/code	Description
0x00000000 ERROR_SUCCESS	The call was successful.

Exceptions Thrown: No exceptions SHOULD be thrown beyond those thrown by the underlying RPC protocol [MS-RPCE].

Processing and Response Requirements:

Clients with any access level can call this method.

3.2.5 Timer Events

No protocol timer events are required other than those in the underlying RPC protocol.

3.2.6 Other Local Events

No local events are maintained other than those in the underlying RPC protocol.

4 Protocol Examples

4.1 Inserting a Record into a WINS Database

The following example illustrates the use of the RPC methods defined in this specification to insert a record into the database of a WINS server. If the WINS database on the specified server does not have a record with name "WINS-TEST-00001", then the client calls the RPC method **R** WinsRecordAction (section 3.1.4.1) with the following parameters:

- *ServerHdl* set to the endpoint of the WINS server on which the **R_WinsRecordAction** method is executed.
- *ppRecAction* pointing to a structure of type <u>WINSINTF_RECORD_ACTION_T (section</u> <u>2.2.2.3)</u>, with members set as follows:
 - **Cmd_e** to WINSINTF_E_INSERT.
 - **pName** to point to the string "WINS-TEST-00001" followed by a NetBIOS suffix of 0x00.
 - NameLen to 16.
 - **TypOfRec_e** to 3, indicating a multihomed record.
 - NoOfAdds to 2.
 - **pAdd** to point to two IP addresses: 192.168.1.1 and 192.168.1.2.
 - **NodeTyp** to 1, indicating a p-node.
 - **fStatic** to 0, indicating a dynamic record.

4.2 Releasing a Record from a WINS Database

The following example illustrates the use of the RPC methods defined in this specification to release a record from the database of a WINS server. If the WINS database on the specified server has a unique record with name "WINS-TEST-00001" mapped to the IP address 192.168.1.1, then the client calls the RPC method <u>R WinsRecordAction (section 3.1.4.1)</u> with the following parameters:

- ServerHdl set to the endpoint of the WINS server on which the R_WinsRecordAction method is executed.
- *ppRecAction* pointing to a structure of type <u>WINSINTF RECORD ACTION T (section</u> <u>2.2.2.3</u>), with members set as follows:
 - **Cmd_e** to WINSINTF_E_RELEASE.
 - **pName** to point to the string "WINS-TEST-00001" followed by a NetBIOS suffix of 0x00.
 - NameLen to 16.
 - TypOfRec_e to 0.
 - NoOfAdds to 1.
 - Add to the IP address 192.168.1.1.

4.3 Deleting a Record from a WINS Database

The following example illustrates the use of the RPC methods defined in this specification to delete a record from the database of a WINS server. If the WINS database on the specified server has a multihomed record with name "WINS-TEST-00001", the client calls the RPC method **R WinsRecordAction (section 3.1.4.1)** with the following parameters:

- ServerHdl set to the endpoint of the WINS server on which the R_WinsRecordAction method is executed.
- *ppRecAction* pointing to a structure of type <u>WINSINTF_RECORD_ACTION_T (section</u> <u>2.2.2.3</u>), with members set as follows:
 - **Cmd_e** to WINSINTF_E_DELETE.
 - **pName** to point to the string "WINS-TEST-00001" followed by a NetBIOS suffix of 0x00.
 - NameLen to 16.
 - **State_e** to 3 (DELETED).

4.4 Modifying a Record from a WINS Database

The following example illustrates the use of the RPC methods defined in this specification to modify a WINS server database record. If the WINS database on the specified server has a multihomed dynamic record with the name "WINS-TEST-00001" and the node type set to p-node, the client calls the RPC method **R** WinsRecordAction (section 3.1.4.1) with the following parameters:

- ServerHdl set to the endpoint of the WINS server on which the R_WinsRecordAction method is executed.
- *ppRecAction* pointing to a structure of type <u>WINSINTF_RECORD_ACTION_T (section</u> <u>2.2.2.3</u>), with members set as follows:
 - **Cmd_e** to WINSINTF_E_MODIFY.
 - **pName** to point to the string "WINS-TEST-00001" followed by a NetBIOS suffix of 0x00.
 - NameLen to 16.
 - **TypOfRec_e** to 3, indicating a multihomed record.
 - NodeTyp to 3.
 - State_e to 1.
 - fStatic to zero.

After executing the call to **R_WinsRecordAction**, the node type and the state of the existing record are modified to h-node and RELEASED, respectively.

4.5 Querying a Record from a WINS Database

The following example illustrates the use of the RPC methods defined in this specification to query a record from the database of a WINS server. This example assumes that the WINS database contained by the specified server has an active multihomed dynamic record named "WINS-TEST-00001" mapped to two IP addresses: 192.168.1.1 and 192.168.1.2. IP address 192.168.1.1 has

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

node type p, and its time stamp set to 0x61. IP address 192.168.1.2 has a version ID type and a time stamp set to 0x101E. The client calls the RPC method <u>**R**</u> WinsRecordAction (section</u> 3.1.4.1) with the following parameters:

- *ServerHdl* set to the endpoint of the WINS server on which the **R_WinsRecordAction** method is executed.
- *ppRecAction* pointing to a structure of type <u>WINSINTF RECORD ACTION T (section</u> <u>2.2.2.3</u>), with members set as follows:
 - **Cmd_e** to WINSINTF_E_QUERY.
 - **pName** to point to the string "WINS-TEST-00001" followed by a NetBIOS suffix of 0x00.
 - NameLen to 16.
- All other members are used for output, which the server assigns as follows:
 - **TypOfRec_e** contains 3.
 - **NoOfAdds** contains 2.
 - **pAdd** points to two IP addresses: 192.168.1.1 and 192.168.1.2.
 - **VersNo** contains 0x61.
 - **NodeTyp** contains 1.
 - **OwnerId** contains the owner IP address of the matching record.
 - **State_e** contains zero (ACTIVE).
 - **fStatic** contains zero.
 - **TimeStamp** contains 0x101E.

4.6 Retrieving All of the Records of a WINS Database

This example illustrates the use of the RPC methods defined in this specification to retrieve all the records from the database of a WINS server.

- The client calls the <u>R WinsGetDbRecsByName</u> method repeatedly with the following parameters.
- Set *pWinsAdd* to NULL, *Location* to zero, *pName* to NULL, *NameLen* to zero, *fStaticOnly*, to 4 and *NoOfRecsDesired* to the desired number of records. As noted in the description of **R_WinsGetDbRecsByName**, the server resets the *NoOfRecsDesired* parameter to 5,000 if the parameter's value is greater than 5,000.
- Check how many R_WinsGetDbRecsByName has returned by looking at the value in the NoOfRecs field. If this value is less than the NoOfRecsDesired value, the retrieval is complete. Otherwise, if the number of returned values is the same as the value of NoOfRecsDesired, call to the R_WinsGetDbRecsByName with the following parameter settings:
- Set *pWinsAdd* to NULL, *Location* to 0, *pName* to the name of the last record retrieved in the previous iteration, *NameLen* to the length of *pName*, *fStaticOnly* to 4, and *NoOfRecsDesired* to the desired number of records.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

• Repeated this procedure until the value of *NoOfRecs* is less than the value of *NoOfRecsDesired*.

4.7 Deleting All the Records of an Owner from a Particular WINS Server

This example illustrates the use of the RPC methods defined in this specification to delete all the records of an owner from the target WINS server.

The client calls the RPC method **<u>R</u>** <u>**WinsDelDbRecs**</u> with the following parameters:

- The endpoint of the WINS server on which **R_WinsDelDbRecs** is executed (or from which the records are deleted as *ServerHdl*.
- Set *MinVersNo*, *MaxVersNo* and *pAdd->Type* to zero 0, *pAdd->Len* to 4, and *pAdd->IPAdd* to the IP address of the WINS server whose records are to be deleted.
- The successful completion of the R_WinsDelDbRecs call deletes all the records for an owner from the target WINS server database.

4.8 Deleting All the Records from a Particular WINS Server

This example illustrates the use of the RPC methods defined in this specification to delete all records from the target WINS server.

The client calls the RPC method **<u>R_WinsStatusNew</u>** with the following parameters:

- The endpoint of the WINS server on which the RPC method is executed, or from which the records are deleted, as *ServerHdl*.
- Set *Cmd_e* to *WINSINTF_E_CONFIG_ALL_MAPS*.
- The output of the call to R_WinsStatusNew, pResults, contains the list of owner addresses in the database of the target WINS server. For each owner address in pResults->pAddVersMaps, call the RPC method R_WinsDelDbRecs (section 3.1.4.9) by setting the parameters as follows:
 - Set *MinVersNo*, *MaxVersNo*, and *pAdd->Type* to 0.
 - Set *pAdd->Len* to 4.
 - Set *pAdd->IPAdd* to pResults->pAddVersMaps[*i*]->Add, where **i** denotes the *i*th iteration.

4.9 Triggering a Pull Replication Between Two WINS Servers

This example illustrates the use of the RPC methods defined in this specification to trigger a pull replication from one WINS server to another.

The client calls the RPC method **<u>R WinsTrigger</u>** with the following parameters:

- Set the value of *ServerHdl* to the endpoint of the WINS server on which the pull replication is queued.
- Set *TrigType_e* and *pAdd->Type* to 0, *pAdd->Len* to 4 and *pAdd->IPAdd* to the IP address of the WINS server that serves as the partner for the pull replication.
- A return value of ERROR_SUCCESS means that the pull request has been queued successfully.

4.10 Backing Up a WINS Server Database

To back up the WINS server database, the client calls the RPC method **<u>R</u>** <u>WinsBackup</u> with the following parameters:

- Set the value of *ServerHdl* to the endpoint of the WINS server on which the backup is performed.
- Set *pBackupPath* to the path on the server where the database is backed up.
- A return value of ERROR_SUCCESS indicates that the backup has been successful.

5 Security

5.1 Security Considerations for Implementers

RAIW allows any user to establish a connection to the RPC server. The protocol uses the underlying RPC protocol to retrieve the identity of the method caller as specified in [MS-RPCE]. Clients create an authenticated RPC connection, and servers use this identity to perform specific access checks.

WINS server data and WINS server operations specified by this implementation are protected by access checks based on the identity of the RPC client.

Servers that implement this specification do not allow anonymous RPC connections and protect WINS access to all data and operations with access control checks based on client identity.

Clients or servers that implement this specification do not use RPC over named pipes because it is vulnerable to man-in-the-middle attacks. RPC over TCP/IP is used instead.

Servers that implement this protocol require clients to request RPC_C_AUTHN_WINNT, and servers enforce this requirement in order to protect the privacy of the communication with clients.

5.2 Index of Security Parameters

Security parameter	Section
RPC_C_AUTHN_WINNT	Section <u>2.1.1</u>

6 Appendix A: Full IDL

6.1 winsif Interface

For ease of implementation, the full stand-alone Interface Definition Language (IDL) file for the <u>winsif</u> interface (section <u>3.1</u>) is provided. Some of the data types and structures used by this protocol are defined in other documents. In order for this IDL to stand alone, the types and structures from [MS-DTYP] are imported.

6.2 winsi2 Interface

For ease of implementation, the full stand-alone Interface Definition Language (IDL) file for the <u>winsi2</u> interface (section <u>3.1</u>) is provided. Some of the data types and structures used by this protocol are defined in other documents. In order for this IDL to stand alone, the types and structures from the <u>winsif</u> interface (section <u>6.1</u>) IDL are imported.

```
import "ms-raiw winsif.idl";
ſ
   uuid(811109bf-a4e1-11d1-ab54-00a0c91e9b45),
   version(1.0),
   pointer default(unique)
]
interface winsi2 {

7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft Windows NT® 4.0 operating system
- Microsoft Windows® 2000 operating system
- Windows® XP operating system
- Windows Server® 2003 operating system
- Windows Server® 2008 operating system
- Windows Server® 2008 R2 operating system

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

<<u>1> Section 2.1.1</u>: Windows NT 4.0: The Remote Administrative Interface: WINS protocol does not define query-level access; the only access level available is control-level access. Clients that invoke RPC have control-level access.

<2> Section 2.2.2.7: Windows 2000, Windows Server 2003, Windows Server 2008, and Windows Server 2008 R2: If the value of the **WINSPriorityClass** member is other than NORMAL_PRIORITY_CLASS or HIGH_PRIORITY_CLASS, the system assumes the latter.

<3> Section 3.1.4.1: Windows NT 4.0: The Remote Administrative Interface: WINS Protocol uses implicit binding, in which the RPC run-time library maintains the handle internally. No RPC methods except **R WinsTombStoneDbRecs**, **R WinsTerm**, and **R WinsGetBrowserNames** take ServerHdl as a parameter.

<4> Section 3.1.4.1: Windows NT 4.0: The RPC method caller is required to have control-level access regardless of the action used.

<5> Section 3.1.4.1: Windows 2000, Windows Server 2003, Windows Server 2008, Windows Server 2008 R2: A maximum of 25 IP address mappings are allowed for a multihomed or special group Name Record.

<6> Section 3.1.4.2: Windows NT 4.0: The <u>R WinStatus</u> caller is required to have control-level access regardless of the command used.

<7> Section 3.1.4.6: Windows NT 4.0: The RPC method caller is required to have control-level access regardless of the command used.

<8> Section 3.1.4.10: The execution of **R** WinsPullRange by a client with sufficient access permissions can cause the WINS service on the target WINS server to restart.

[MS-RAIW] — v20110204 Remote Administrative Interface: WINS Specification

Copyright © 2011 Microsoft Corporation.

<9> Section 3.1.4.14: Windows NT 4.0: The <u>R_WinsGetNameAndAdd</u> caller is required to have control-level access regardless of the command used.

<10> Section 3.1.4.14: Windows NT 4.0: The <u>**R**</u> WinsGetNameAndAdd</u> caller does not need access permissions to call this method.

<11> Section 3.1.4.19: Windows NT 4.0: The RPC method caller is required to have control-level access regardless of the command used.

<12> Section 3.2.4.2: Windows NT 4.0: This RPC method is not supported.

8 Change Tracking

This section identifies changes that were made to the [MS-RAIW] protocol document between the January 2010 and February 2011 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- An extensive rewrite, addition, or deletion of major portions of content.
- The removal of a document from the documentation set.
- Changes made for template compliance.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the language and formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical or language changes were introduced. The technical content of the document is identical to the last released version, but minor editorial and formatting changes, as well as updates to the header and footer information, and to the revision summary, may have been made.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.

- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- New content added for template compliance.
- Content updated for template compliance.
- Content removed for template compliance.
- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated.**

Some important terms used in the change type descriptions are defined as follows:

- Protocol syntax refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- Protocol revision refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact protocol@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
1 Introduction	53470 Changed "Windows Internet Name Service (WINS) server" to "Windows Internet Name Service (WINS)" and "WINS" to "WINS server".	N	Content update.
<u>1.1</u> <u>Glossary</u>	53130 Added "ACTIVE" and "RELEASED" to the local glossary.	N	Content update.
<u>1.1</u> <u>Glossary</u>	53410 Added the term "owner WINS server".	N	Content update.
<u>1.1</u> <u>Glossary</u>	53470 Added a definition for local term "WINS server". Added instances of the local term "WINS server". Expanded first instance of "NetBIOS name server".	N	Content update.
<u>1.1</u> <u>Glossary</u>	53477 Added "partner", "pull partner" and "replication partner" to the local glossary.	N	Content update.
<u>1.1</u> <u>Glossary</u>	54336 Added the [MS-GLOS] terms "domain name", "Domain Name System (DNS)", and "NetBIOS suffix". Added the local term "NetBIOS scope". Removed the local term "domain name record".	N	Content update.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
<u>1.1</u> <u>Glossary</u>	Added "Unicode string" and updated "UTF- LE (Unicode Transformation Format, 16-bits, little-endian)" to its expanded form.	N	Content update.
<u>1.1</u> <u>Glossary</u>	Added the [MS-GLOS] terms "Internet Protocol version 6 (IPv6)" and "IPv4 address in string format".	N	Content update.
<u>1.1</u> <u>Glossary</u>	Changed "host name" to "HostName". Added [MS-GLOS] "client" term.	N	Content update.
1.2.2 Informative References	Added [LMHOSTS] reference.	N	Content update.
1.2.2 Informative References	Added a reference to RPC binding handles.	N	Content update.
1.3 Overview	53133 Changed "may" to "can" in the discussion of locking configuration and state data.	N	Content update.
2.1.1 Server Security Settings	Replaced references to undefined WINS access constants with "control-level access".	N	Content update.
2.2.1.3 WINSINTE MAX NO RPL PNRS	53131 Updated the topic introduction and constant table description.	Y	Content update.
2.2.1.8 WINSINTF SCV OPC E	53410 Changed the reference to "owner WINS servers" to a reference to "owner NBNS servers".	N	Content update.
2.2.2.3 WINSINTE RECORD ACTION T	53122 Added details concerning the value 3 for the NodeTyp member.	N	Content update.
2.2.2.3 WINSINTF RECORD ACTION T	53476 Added prescriptive "SHOULD" concerning the possible values of the NoOfAdds member.	N	Content update.
2.2.2.3 WINSINTE RECORD ACTION T	54140 Clarified possible values of NodeTyp and State_e members.	N	Content update.
2.2.2.3 WINSINTE RECORD ACTION T	54335 Changed the value of the NoOfAdds member from 0x00000001 to zero for unique names.	N	Content update.
2.2.2.3 WINSINTF RECORD ACTION T	54336 Added details concerning the NetBIOS name and NetBIOS scope name strings as specified by the pName and NameLen members.	N	Content update.

Copyright © 2011 Microsoft Corporation.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
2.2.2.4 WINSINTF ADD VERS MAP T	53655 Removed the statement about the Add field that was present in the VerseNo field description.	N	Content update.
2.2.2.6 WINSINTF STAT T	53127 Clarified how the LastNTRplTime and LastACTRplTime time stamp members are ignored.	N	Content update.
2.2.2.6 WINSINTE STAT T	53133 Changed "may" to "can" in the NoOfUniqueCnf and NoOfGroupCnf descriptions.	N	Content update.
2.2.2.7 WINSINTF RESULTS T	53127 Clarified how the MyMaxVersNo member is ignored.	N	Content update.
2.2.2.7 WINSINTF RESULTS T	53133 Changed "must" to "MUST" in the HIGH_PRIORITY_CLASS description.	N	Content update.
2.2.2.7 WINSINTF RESULTS T	53476 Added prescriptive "SHOULD" and product behavior note concerning the possible values of the WINSPriorityClass member.	N	New product behavior note added.
2.2.2.8 WINSINTF RECS T	53127 Clarified how the TotalNoOfRecs member is ignored.	N	Content update.
2.2.2.11 WINSINTF RESULTS NEW T	53127 Clarified how the MyMaxVersNo member is ignored.	N	Content update.
2.2.2.11 WINSINTF RESULTS NEW T	53133 Changed "must" to "MUST" in the HIGH_PRIORITY_CLASS description.	N	Content update.
2.2.2.12 WINSINTF SCV REQ T	53127 Clarified how the Age member is ignored.	N	Content update.
<u>3</u> <u>Protocol Details</u>	53468 Removed the note "The preceding conceptual functions can be implemented using a variety of techniques".	N	Content update.
3.1.1 Abstract Data Model	53474 Specified how the "Browser name cache" abstract data model (ADM) element is initialized and used.	N	Content update.
<u>3.1.1</u>	53485	Ν	Content

Abstract Data Model	Clarified that the list of server configuration parameters is maintained in persistent storage. Removed the note at the end of the section.		update.
3.1.4.1 <u>R WinsRecordAction (Opnum 0)</u>	53133 Changed "should be" to "is" in the ServerHdl description and changed "it should" to "the caller SHOULD" in the Processing and Response Requirements list.	Ν	Content update.
3.1.4.1 <u>R WinsRecordAction (Opnum 0)</u>	54142 Clarified the descriptions of the pName members. Added qualifiers to member references. Added prescriptive terms to actions prescribed for the server.	Ν	Content update.
3.1.4.1 R WinsRecordAction (Opnum 0)	54336 Changed the description of the pName and NameLen members of the WINSINTF_RECORD_ACTION_T structure.	N	Content update.
3.1.4.1 R WinsRecordAction (Opnum 0)	54395 Changed the timestamp value to zero for inserted static records.	N	Content update.
3.1.4.1 R WinsRecordAction (Opnum 0)	Replaced a reference to an undefined WINS access constant with "control-level access".	N	Content update.
3.1.4.1 <u>R WinsRecordAction (Opnum 0)</u>	Added full name of specified protocol.	N	Product behavior note updated.
3.1.4.2 R WinsStatus (Opnum 1)	53133 Changed "should be" to "is" in the ServerHdl description.	N	Content update.
3.1.4.2 R WinsStatus (Opnum 1)	Replaced a reference to an undefined WINS access constant with "control-level access".	N	Content update.
3.1.4.3 <u>R WinsTrigger (Opnum 2)</u>	53133 Changed "should" to "SHOULD" and "The server can also" to "Also, the server SHOULD" in the call to R_WinsTrigger recommendations list.	N	Content update.
3.1.4.4 R WinsDoStaticInit (Opnum 3)	53126 Changed "R_WinsTrigger" to "R_WinsDoStaticInit" in the processing and response requirements.	N	Content update.
3.1.4.4 <u>R WinsDoStaticInit (Opnum 3)</u>	53133 Changed "should be" to "is" in the ServerHdl description. Added a prescriptive verb to the	N	Content update.
